| WRMP985   | <p>Southern Water Revised Draft Water Resource Management Plan 2024</p> <p>Dear Defra,</p> <p>My understanding is that a Water Resource Management Plan should be a strategic plan that seeks to address both local and regional issues of water distribution and supply, whilst meeting environmental standards and climate challenges. I do not believe that this Southern Water draft WRMP fulfils these criteria.</p> <p>Southern Water appears to have tunnel vision with regard to effluent recycling. Even now with this revised plan it continues to promote effluent recycling as its preferred option. What assessment system have they employed to arrive at this decision? Surely it must be flawed and needs close scrutiny. The proposed scheme is inherently expensive. It is inherently energy demanding (excessively so). It is inherently bad for the environment, exacerbated in this case by the close proximity of the Waste Water Recycling Plant to harbours of international importance for biodiversity. Furthermore, it is not sustainable in relation to climate change, emissions, or infrastructure longevity.</p> <p>Yes, effluent recycling is used in other parts of the world where there are no other viable options. Expensive though it is, it can work, but the advanced technologies involved must be properly maintained. Southern Water has a poor track record of plant maintenance, with multiple failures in recent years. I have serious concerns about the risk of contamination of the Havant Thicket Winter Storage Reservoir and south coast harbours resulting from procedural failures or inadequate maintenance schedules because asset stripping has resulted in a worrying lack of operational resilience within the company.</p> <p>Here in the UK effluent recycling simply isn't necessary. We are not drought stricken, we have plenty of rain, even in the south. Water companies (and society as a whole) just fail to capture enough of it. They must do better. Of course, in addition to too little water capture, there is a well-publicised and significant waste of water. Southern Water loses 19% of its water during customer distribution. Hardly surprising when the company works to a mains replacement rate of 1000 years!! It is not good enough. Even quadrupling the current mains replacement rate will still fall woefully short of accepted industry standards.</p> <p>Furthermore, Southern Water's lack of consultation with its customers regarding their plans for effluent recycling has been nothing short of abysmal. There have been ample opportunities for the company to inform customers of their plans when sending out invoices and other communications, but there has been nothing. Given that this would be a fundamental change to the supply of water there should have been a public awareness campaign. In fact, quite the reverse is true, and Southern Water appears to have tried very hard to mis-inform and hide information throughout the process.</p> <p>Specific Issues</p> <p>Siting of the Waste Water Recycling Plant (WWRP)</p> <p>Southern Water's intended location for the WWRP plant is at Broadmarsh, a former landfill site close to the shore of Langstone Harbour Ramsar/SPA/SAC/SSSI. Construction of the plant will require hundreds of pilings and shafts to be sunk into and through the landfill and into an</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We note the objection to the use of recycled water in Havant Thicket. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>We have dedicated budget for both proactive and reactive maintenance work and the budget is periodically reviewed to prioritise key maintenance activities.</p> <p>Our consultation engagement with our customers and stakeholders is described in Annex 5 of our rdWRMP24 Technical Report. In addition to publishing the majority of our rdWRMP24 documents on our website, we arranged 8 roadshows across our supply area during October–November; 3 in our Western area, 2 in our Central area and 3 in our Eastern area. Southern Water staff were available at these roadshows to answer any questions on our rdWRMP24. Hard copies of our rdWRMP24 Technical Report and Non-Technical Summary of our plan were also available for attendees to view and take with them. In addition, we provided 5 area-specific webinars of 75 minutes duration each whereby we presented key features of our plan during the first 35–40 minutes with the remaining time allocated to Q&amp;A. We released a press release regarding the consultation, which was picked up by major newspapers; <i>The Guardian</i> and the <i>Financial Times</i>. We produced both targeted and non-targeted adverts on social media. We also publicised the consultation in our newsletter which went out to all of our customers. MPs, Stakeholders and previous responders were all directly emailed regarding the consultation.</p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|           | <p>aquifer. This has significant potential to lead to contamination of the aquifer and the adjacent SPA/Ramsar sites in the harbours through leaching of landfill materials. In addition, it is deeply concerning that the wastewater from the plant will be pumped out into the Solent risking further environmental damage to these sensitive sites. Engineering solutions to overcome these issues will be unnecessarily complex and costly. If nothing else, the WWRP should be moved to an alternative, less damaging location nearby, or to [REDACTED] WTW.</p> <p>Detrimental Effects on Havant Thicket Winter Storage Reservoir</p> <p>Havant Thicket WSR was originally a very sustainable solution to help address the need for water in this region. The first new reservoir in the region for many years. I fully supported it. It will be the first chalk spring-fed reservoir in the world. Southern Water now wish to top up the spring water with recycled effluent. Yes, it will be treated, but not all the chemicals will be removed it is still effluent based with all the inherent dangers that poses (hormones, pharmaceuticals etc). It is deeply concerning that reservoir will be used in this way. The recycled water pumped in from the WWRP will be much more saline and have a significantly different geochemical composition to the spring water in the reservoir and as such has the potential to be very detrimental to the biodiversity of the new wetland that is to be created as an integral part of the reservoir project. I do not believe there has been appropriate modelling to determine the effects of the recycled water on the biodiversity since this scheme was proposed. The mixed recycled water from the reservoir will also change the taste of the final drinking water product which, though potable, may prove unpalatable to customers. This would then lead to an increased uptake of bottled water – something which is common in other parts of the world where effluent recycling operates – with all the negative environmental impacts associated with production and disposal of plastic waste.</p> <p>Changes to OFWAT Funding Mechanism</p> <p>It is very difficult to understand how Southern Water has arrived at its preferred options for this draft WRMP. Somehow effluent recycling comes top of the list, with tankering water in from Norway as the back-up plan. Water from Norway! This is ridiculous. It is a fanciful option, akin to bringing icebergs from the Arctic. How do these options make it to the top of the list? Both options are incredibly carbon-hungry and as far from sustainable as it is possible to get. Unbelievably, effluent recycling actually has a worse carbon footprint than using tankers because, in order to maintain the process, it has to run 365 days a year, including for large parts of the year when the water is not even needed.</p> <p>This effluent recycling scheme requires a vast amount of expensive new infrastructure, and one wonders if this is why Southern Water has chosen this scheme. Not because it makes sense, or is best for its customers, but because it extracts the biggest profit from the current OFWAT funding mechanism.</p> <p>Of course, there must be investment in the water industry and companies need to make profits, but Defra must ensure that the funding mechanism is changed so that projects which deliver sustainable, climate-friendly, customer-focused projects are prioritised. There has been far too much asset stripping of water companies in recent decades and a serious lack of investment in maintaining and upgrading existing infrastructure.</p> <p>Protecting the Chalk Rivers</p> | <p>landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations.</p> <p>Work formally paused on investigating and developing Fareham Wastewater Treatment Works as a back-up option in May 2023, in agreement with RAPID, and so we have not developed it to the same level as HWTWRP. A Back Up option was also identified. This involved transfer of recycled water from a water recycling plant to Itchen WSW via an environmental buffer. Desalination options were removed from further consideration at this stage. The outcome of the options appraisal process was supported by RAPID at Gate 2. Although both HWTWRP and the Back Up option were able to meet requirements of supplying 75Ml/d in the Western Area (as required by WRMP19), and were able to meet the identified future need of up to 90Ml/d, HWTWRP presented significantly better value for customers and was better able to meet long-term regional supply requirements due to improved adaptability. Therefore, the focus was on progressing HWTWRP as the selected option.</p> <p>Supplementing Havant Thicket reservoir with purified recycled water will create a new sustainable source of supply. Regarding effects of recycled water on the chemistry of Havant Thicket reservoir, purified recycled water is extremely clean. Water quality in the reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025.</p> <p>The water quality modelling and assessments undertaken so far have shown that there are unlikely to be any ecological or biodiversity impacts in the Solent from the water recycling process. Water quality in the reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025.</p> <p>Regarding the quality of recycled water, just as water across the country has its own distinct taste influenced by the geology of the local area, so the water taken from Havant Thicket reservoir may taste different from existing supplies due to the spring water being open to the elements, together with the addition of recycled water. However, the water at customers' taps will continue to meet strict drinking water quality standards and be wholesome to drink. We are working closely with international experts, regulators and environmental organisations to develop the plans and ensure this. For more information about water recycling, please visit the government website <a href="https://dwi.gov.uk/water-recycling/">https://dwi.gov.uk/water-recycling/</a></p> <p>Customer insight locally and nationally shows broad support for water recycling. We don't expect customers to buy bottled water when the clean, wholesome water coming from their taps continues to meet strict UK water standards and is many hundreds of times cheaper.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|           | <p>One of the main drivers for Southern Water is its need to minimise pollution incidents and reduce water abstraction from rivers, especially the chalk streams like the Test and Itchen. It has rightly been fined by the Environment Agency on a number of occasions. Southern Water says that effluent recycling is required to achieve this, thereby protecting the rivers. There are however other options available, which the company is aware of, but which it refuses to bring on-line at this time. These options which include moving abstraction points downstream to weirs closer to tidal limits and creating new winter water storage facilities in confined aquifers, would be easier to implement, cheaper for customers, less damaging to the environment, require less new infrastructure and would deliver broader biodiversity benefits to the catchments.</p> <p>WRMPs are, I believe, intended to encourage water companies to develop regional distribution networks to share water across catchment and company boundaries for greater sector resilience. With Southern Water's network now connected to the Portsmouth Water network, sites for aquifer storage or new reservoirs could be developed anywhere in Hampshire or West Sussex and shared.</p> <p>Temporary Use Bans</p> <p>I would ask that Defra looks at so-called "Hosepipe Bans." Too much is made in the media and by successive governments of these temporary water restrictions. In a country with fluctuating rainfall now further compounded by climate change, there will be times when water is less available. Hosepipe bans are useful way to remind people to be careful with water and to value it, rather than taking it for granted. Occasional bans should be an acceptable part of life as long as they are fully justified and are for the right reasons.</p> <p>In summary, I ask that Defra rejects Southern Water's submission for effluent recycling. It is not in customers' best interests, it is certainly not good for the environment, it is overly expensive, and it is not necessary in a country that has perennial issues with flooding. Defra must require Southern Water to pursue more sustainable, adaptable solutions which work alongside climate change and work for the environment. I would also ask that where possible Defra works more rapidly to progress the implementation of broader policies for water catchment in the construction industry (e.g. Building Regulation improvements) and across society (e.g. sustainable drainage for agriculture and golf courses).</p> | <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p> <p>Regarding the viability of sea tankering, this option is no longer included in our plan.</p> <p>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact. As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible. We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish. One of the complications with moving abstractions close to sea is the impact of tides on the duration of abstraction and water quality. We will be exploring them further for our next plan.</p> <p>A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Regarding storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs.</p> <p>We will continue to rely on Temporary Use Bans (TUBs) and Non-Essential Use Bans (NEUBs) as means to reduce demand during droughts.</p> <p>We have a dedicated team who scope and deliver natural solutions to reduce the water quality risks to our drinking water supplies, and deliver ecological resilience schemes as part of a suite of mitigation measures, including abstraction licence reductions, to address identified impacts from our abstractions. In AMP8 we are investing £90m on natural solutions, including habitat and biodiversity improvements, reduced risk of spread of invasive non-native species, in river enhancements, catchment management with the agricultural sector and Catchment Partnerships, chalk stream enhancement and SSSI management. This is a long term programme that started in AMP6, and natural solutions are embedded in our long term delivery plans.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| WRMP987   | <p>Dear Sir or Madam,</p> <p>This is a letter from a concerned resident, local business man and family man:</p> <p>Simply put I believe that the proposal does little if anything to benefit the consumer and everything to give the company an excuse to hugely hike the price of water in our borough.</p> <p>All who have spent time looking at the plans would far prefer that the newly created Havant Reservoir was used to collect rain water rather than recycled grey water. It would also be far preferable if the water within the reservoir was used to service the Havant Borough rather than be sent to Southampton as a result of Southern Waters over abstraction on the Test and Itchen.</p> <p>The many leaks within the borough need fixing, more rainwater needs collecting, and a more holistic approach needs to be used rather than paying for exorbitant technologies better suited to water poor countries such as the Arab states being used to treat water here. The UK is becoming increasingly wet and windy as a result of climate change and this presents an opportunity to help service our water needs.</p> <p>I am entirely against this proposal, and wonder what our water supply will contain in a decades time should this proposal go ahead. We know that currently our tap water is full of toxins including levels of nitrates well above WHO recommended levels, we have heavy metals, plastics and PAHs coming out of our taps and all this before its recycled from our effluent. I dread to think of how much worse it may become.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers.</p> <p><a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history.</p> |

|           | <p>No to recycling. We dont need it (fix the leaks), we dont want it (collect the increasing amount of rain), and we wont pay for it - we are already paying southern water for services they supposedly provide but fail to deliver - such as waste water treatment. If they cant treat our waste will they really be able to provide our water in this manner. I do not believe so. It seems an increasingly complex solution to a very simple problem - leaks and water storage.</p> <p>The government needs to step up and make water companies responsible for the degradation of our natural resources. This proposal benefits the corporation - and doubtles the nameless MP's who have shares in this company now registered in Hong Kong. People and pure water not profit and pollution please Defra.</p> | <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward. A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>Using the reservoir to store purified recycled water has been selected as the optimum way of making up a large part of the shortfall we face in Hampshire and to create a sustainable source of supply. Pumping 60 million litres of water a day into the reservoir will allow up to 90 million litres a day to be taken during a drought.</p> <p>We are working closely with international experts, regulators and environmental organisations to develop the plans and ensure this. The advanced treatment processes used in water recycling are used around the world to remove nutrients, pharmaceuticals and other impurities. Reverse osmosis and other elements of the Full Advanced Treatment process provide robust removal of impurities including "forever chemicals" in the purified recycled water produced.</p> <p>We note your point on rainwater storage and our plan does include constructing two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. It is worth nothing that reservoirs do require a unique set of geological, geomorphological and hydrological settings to be viable.</p> |
| WRMP988   | <p>Dear Defra team,</p> <p>I live in Hampshire and am very concerned about the environment and climate change and am therefore writing to object to Southern Water's revised draft Water Resources Management Plan. My objection concerns [REDACTED] WWTW at Havant and the fact that Southern Water are proposing to use Portsmouth Water's Havant Thicket Reservoir for use as an environmental buffer lake. Recycled effluent will be pumped to Havant Thicket reservoir, with an equivalent volume of mixed water from the reservoir then being moved via a new 40km pipeline from Havant to [REDACTED] Water Supply Works near Winchester, for final treatment into the Southern Water supply network.</p> <p>For me this has two main issues:</p>                                                             | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We note the objection to the use of recycled water in Havant Thicket.</p> <p>Water from the water recycling plant will be used all year round to supply Southern Water customers, following further environmental restrictions including abstraction limitations from Natural England's Common Standards Monitoring Guidance conditions. These conditions set new year-round flow targets for the River Itchen and proposed targets for future implementation on the River Test, reducing the water available, both in the summer and winter.</p> <p>Regarding possible operational issues, the plant will monitor the quality of the treated effluent from Portsmouth Harbour WTW and will shut down if this moves outside of the treatable</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|           | <p>1. The use of reverse osmosis: the effluent recycling plant is documented for use as a 'drought resource' but the plant will have to operate year round, even when the water is not needed, in order to maintain the 'sweetening flow' needed to keep the pumps and membrane filters in good working order. This will require huge amounts of energy. Many experts with experience of running reverse osmosis plants in the UK and elsewhere have found they are very difficult and expensive to operate and maintain. Most companies have ultimately abandoned them, including Thames Water. Southern Water have a poor record of treatment plant and pumping station failures, many prosecutions for pollution incidents and failure to take prompt action to rectify problems. The risk of pollution to the Havant Thicket Reservoir as well as damage to Langstone Harbour and the Solent is unacceptable.</p> <p>2. The proposed pipeline: The route will cut a 40km swathe through the countryside, 50m wide (reducing to 20m in 'sensitive areas'). We are facing an ecological crisis. The pipeline will block habitat connectivity for small birds, bats, other small mammals, insects and other fauna. Many rare bat species depend on hedges and tree lines for commuting and foraging, with roosts in trees. Gaps as small as 10m will block many species from following a commuting corridor. Such a large project will remove alternative routes that the bats could take, so they are unable to reach foraging areas when travelling from their roosts (see <a href="http://www.whatthesciencesays.org/briefing-sheet-hedgerows/">www.whatthesciencesays.org/briefing-sheet-hedgerows/</a>). The construction of the pipeline will have also an enormous carbon footprint due to soil disturbance and concrete manufacture etc.</p> <p>I firmly believe that this plan is following the wrong path. We need to focus on developing more sustainable solutions, which work with climate change to collect the forecast increase in winter rainfall and store it in new reservoirs and confined aquifers for use in dry summers. We get plenty of free rain but only collect 1% of rainfall in the UK. Collecting and storing more water in winter would also provide multiple benefits to society, helping to reduce the forecast increase in flooding, provide recreational sites for our communities, and provide biodiversity opportunities if we build more reservoirs. We also need to work on reducing leaks in the system. A further suggestion is to abstract water for Southampton from the lower reaches of the Test and the Itchen rather than the upper reaches as at present. This would mitigate the need for water being brought from Havant Thicket. I believe these options have not been presented as alternatives to the plan.</p> <p>As I understand it part of the problem is the way water companies can get funding. It is much easier to obtain funding for large infrastructure projects. Using lots of smaller solutions may be better for the environment and more cost effective but does not secure funding. This situation is completely wrong and needs to be addressed.</p> | <p>parameters. The recycled water will also have a lower nitrate level than the spring waters, due to the treatment at Portsmouth Harbour WTW.</p> <p>Using Havant Thicket reservoir to store purified recycled water has been selected as the optimum way of making up a large part of the shortfall we face in Hampshire. Pumping 60 million litres of water a day into the reservoir will allow up to 90 million litres a day to be taken during a drought.</p> <p>Multiple options were considered during the options appraisal process that was carried out as part of the RAPID gated process to identify alternatives to West Southampton Coast desalination and the HWTWRP consistently scored higher than other options. It was approved by RAPID for adoption as the preferred Strategic Resource Option (SRO) to be progressed in Hampshire. Please see section 3.2 in our fdWRMP24 for more detailed reasoning on why West Southampton Coast desalination was not taken forward beyond RAPID Gate 2.</p> <p>All plans will be subject to the appropriate environmental due diligence as they evolve.</p> <p>Regarding storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. At local scale, we have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives. A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory</p> |

One of the complications with moving abstractions close to sea is the impact of tides on the duration of abstraction and water quality. We will be exploring them further for our next plan.</p> <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| WRMP989   | <p>Dear Defra,</p> <p>I am deeply concerned about Southern Waters proposals for an effluent recycling facility at Havent. It looks like the worst choice.</p> <p>It would be very expensive to run due to the amount of energy needed.</p> <p>I'm worried that Southern Water would fail to manage this complex process effectively and frequent breakdowns supply and safety issues could ensue</p> <p>Surely, tackling Leakage, mains renewal and increasing sustainable storage (eg using aquifers or reservoirs) should be prioritised over recycling effluent in the first instance. These steps would reduce the need for effluent recycling and be far more efficient in terms of energy usage, timescale and carbon footprint.</p> <p>I'm not sure I'd even want to drink the water from effluent recycling because I wouldn't trust it to taste good or have had all the toxins fully removed. I'd much rather more rainwater was saved and fewer leaks.</p> <p>I'm concerned that the construction on that site would affect the local ecology and water table.</p> <p>I'm concerned that the concentrated by product will damage ecosystems at the outflow and would migrate to pollute Chichester harbour.</p> <p>It just seems the wrong approach because recycling effluent before focussing on controlling leakage and increasing sustainable storage is like putting the 'cart before the horse'.</p> <p>I question their choice to pursue effluent recycling over simpler, cheaper and greener solutions. Is it driven by the pursuit of profit? I question their population figures as these seem rather inflated.</p> <p>I have read these suggestions for what DEFRA ought to do and I agree:</p> <ol style="list-style-type: none"> <li>1. Scrutinise the population figures that are used for the business case</li> <li>2. Demand the leakage and mains renewal programme are accelerated and brought forward more quickly. Striving for a 70% reduction in leakage by 2050.</li> <li>3. Add moving the abstractions on rivers to the tidal limits/ final weir as an option now so it can be assessed by the Environmental Agency now.</li> <li>4. Brind forward the investigations and trials on the use of identified confined aquifers to store winter water for use in dry summers, not delay this for consideration in WRMP29.</li> <li>5. Bring forward the Test Managed Aquifer Storage scheme, with investigation and testing starting immediately.</li> <li>6. Identify more sites for reservoir storage.</li> <li>7. Require the environmental impacts of effluent recycling and desalination schemes to be better understood before they are selected.</li> </ol> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We note the objection to the use of recycled water in Havant Thicket.</p> <p>Regarding possible operational issues, the plant will monitor the quality of the treated effluent from Portsmouth Harbour WTW and will shut down if this moves outside of the treatable parameters. The recycled water will also have a lower nitrate level than the spring waters, due to the treatment at Portsmouth Harbour WTW.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>We consider that current water mains have an average asset life of approximately 100 years. If 0.5% of mains are renewed each year this would mean that, on average, a main is expected to last for 200 years. There are different views in the water sector on the appropriate rate of mains renewal and the amount of investment needed on asset health overall. Our economic regulator Ofwat in its December 2024 final determinations published a roadmap for enhancing understanding of asset health in the sector <a href="https://www.ofwat.gov.uk/publication/pr24-final-determinations-roadmap-for-enhancing-asset-health-understanding-in-the-water-sector">https://www.ofwat.gov.uk/publication/pr24-final-determinations-roadmap-for-enhancing-asset-health-understanding-in-the-water-sector</a> It is too early to say what the outcome of that work will be in relation to future rates of mains renewal.</p> <p>Regarding storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. At local scale, we have been promoting the use of water butts since we started implementing our universal metering programme back</p> |

|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>8. Retain the threat of Hosepipe bans as a mechanism to educate and nudge consumers into reducing their water use.</p> <p>9. Use tiered, monthly water billing so the lowest consumers are rewarded and the most wasteful consumers pay for all consumers who use less than 100l/day.</p> <p>Please use your position and expertise to scrutinise this plan and apply some common sense to help deliver the best solution for customers and for the environment.</p> | <p>in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>Regarding the quality of recycled water, just as water across the country has its own distinct taste influenced by the geology of the local area, so the water taken from Havant Thicket reservoir may taste different from existing supplies due to the spring water being open to the elements, together with the addition of recycled water. However, the water at customers' taps will continue to meet strict drinking water quality standards and be wholesome to drink. We are working closely with international experts, regulators and environmental organisations to develop the plans and ensure this. For more information about water recycling, please visit the government website <a href="https://dwi.gov.uk/water-recycling/">https://dwi.gov.uk/water-recycling/</a></p> <p>A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations.</p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history. It should be noted that Southern Water has temporarily suspended dividends to shareholders and has not paid dividends since 2017. Also, the £1.6 Billion investment funding received from Macquarie Asset Management has been paid to Southern Water Group and none of this amount has been paid to previous shareholders.</p> <p>For dWRMP24 we, together with the other WRSE companies, commissioned Edge Analytics to provide growth forecasts for all companies, in line with government guidelines. Edge Analytics used the latest available local plan data, as well as data from the Office for National Statistics (ONS) and the Greater London Authority (GLA), to produce projections at a WRZ</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                       | <p>level. Separate forecasts were developed for total population, household population, non-household population, dwellings, dwellings occupancy, population in commercial properties and business counts. Following the publication of latest WRPG in March 2023, we commissioned an update to that forecast (along with other WRSE companies), which enabled us to consider growth under five different projections based on data from Local Authorities, ONS and OxCam. We have not based our plan on a single population forecast but have used a range of population forecasts to determine the nine future supply-demand balance scenarios that we have planned for (see Section 5.5.3 of the rdWRMP24 Technical Report). The estimates of future population growth range is from 7% to 34% growth at the company level between 2025 and 2075. The range of growth forecasts considered each of our WRZs is shown in Section 2 of Annex 7 that accompanied rdWRMP24 Technical Report. As part of our adaptive planning approach, we will track population growth and switch to the most appropriate supply-demand balance situation.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish. One of the complications with moving abstractions close to sea is the impact of tides on the duration of abstraction and water quality. We will be exploring them further for our next plan.</p> <p>The investment model needs to objectively select options based on standardised input criteria. It cannot be configured to preferentially select either smaller or larger options as that will lead to biased results and it cannot be demonstrated that the preferred plan is either least cost or best value.</p> <p>We will continue to rely on Temporary Use Bans (TUBs) and Non-Essential Use Bans (NEUBs) as means to reduce demand during droughts.</p> <p>We plan to conduct tariff trials once our smart metering plan is implemented and we have a better understanding of the way demand varies daily and seasonally along with key household attributes (property type, household composition, socio-demographic variables etc). This will help us select a representative sample as well as an appropriate tariff model (rising block, reducing block, seasonal) to test.</p> |
| WRMP990   | <p>Hello</p> <p>I am unfortunately a Southern Water customer. I live in Emsworth. I am also a year round sea swimmer, so I know a bit about Southern Water's exceedingly poor performance doing the job all the other customers and I pay them to do.</p> <p>I have heard about Southern Water's plans to use the new Havant Thicket reservoir as an effluent recycling facility.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Reference | Feedback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|           | <p>I reject this proposal on the grounds that I have zero trust in Southern Water to deliver the plan safely. The effluent recycling scheme they propose is untested in the UK. Why would we trust a major polluter to accurately and safely use new reverse osmosis technology to provide clean water?</p> <p>The landfill site they have chosen is another major red flag, as is their complete disregard for greener solutions such as harvesting rainwater and fixing leaks in existing pipes.</p> <p>When I went for a swim today from Emsworth Sailing Club (with 8 other women), we were all disgusted by large brown bubbles, that did not pop when swam near, floating on the surface of the water. It's a daily reminder of the negligence of our water company, who are meant to be providing the most basic of all human rights!</p> <p>Southern Water, clean up your act. Defra, please force them to do better.</p> | <p>why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers.</p> <p><a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water. The plant will monitor the quality of the treated effluent from Portsmouth Harbour WTW and will shut down if this moves outside of the treatable parameters. The recycled water will also have a lower nitrate level than the spring waters, due to the treatment at Portsmouth Harbour WTW.</p> <p>Our Water Resources Management Plan covers our plan for provision of drinking water. Our treatment processes are designed to treat the water quality found in the water sources we rely upon. For further information on sewage treatment please refer to our Drainage and Wastewater Management Plan which you can find here:</p> <p><a href="https://www.southernwater.co.uk/about-us/our-plans/drainage-and-wastewater-management-plans/">https://www.southernwater.co.uk/about-us/our-plans/drainage-and-wastewater-management-plans/</a></p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response.</p> <p>We have to meet very challenging demand management and Environmental Destination targets set by the Government. The resulting scale of supply-demand balance deficits requires us to be ambitious as well as innovative to meet future challenges. Environmental sustainability is a key criterion for including options in our plan, regardless of the size of the option. Your objection to the use of recycled water in Havant Thicket is noted.</p> <p>We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives. We have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can</p> |

We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| WRMP991   | <p>Dear Sir/Madam</p> <p>I wish to register my strong objection to Southern Water's revised draft Water Resources Management Plan and request it be rejected by DEFRA. I believe this Plan is flawed, self-serving and short-sighted.</p> <p>This current Plan is barely different to the last one which was rejected by DEFRA. The present Plan seeks to justify Southern Water's proposals for energy-intensive, profit-driven schemes such as effluent recycling rather than working towards more long-term sustainable, cost-effective and environmentally-friendly alternatives.</p> <p>Southern Water currently loses 100 million litres of treated water daily through leaks, amounting to 19% of its supply. The revised Plan states Southern Water aims to reduce this to 10% by 2050 - this isn't ambitious enough over such a 25-year period. Before Southern Water is permitted to build costly new infrastructure, it should repair the existing one.</p> <p>Southern Water has largely ignored or dismissed sustainable solutions like expanding reservoirs, using aquifer storage and moving extraction points. I am aware that the UK only collects 1% of its rainfall. Why isn't there more focus in the Plan on improving this figure, especially given climate change and global warming is likely to increase rainfall? In the past Southern Water has complained that the planning system has held up reservoir plans but this is blatantly untrue where Havant Thicket is concerned. Once applied for, planning permission for the original Reservoir fed by chalk-fed streams was obtained pretty quickly.</p> <p>One proposed site for an aforementioned effluent recycling plant is at Broadmarsh (Havant) which would be built on an old landfill site, risking contamination of Langstone Harbour through leaching during construction. The proposed plant risks being a costly white elephant, involving major construction work for this and the proposed pipeline to [REDACTED] costing £1.2 billion and rising, the burden of which will result in significant bill increases for local residents.</p> <p>The Plan even includes bizarre suggestions to tanker water from Norway - an idea previously dismissed as expensive, environmentally unsound and risky.</p> <p>I urge DEFRA to reject Southern Water's plan in favour of more sensible, rational options.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Regarding our options process, we carry out an options appraisal exercise when we update our plan every 5 years. This exercise is usually carried out by an external consultant and looks at new options as well as options that were previously considered but were not taken forward for a variety of reasons. Cost is one of the factors considered in the options appraisal process but is not the only determining factor. We also need to look at factors such as volume of water that an option can provide, its resilience to climate change, environmental impact etc. in addition to capital and operating costs. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process. We note the objection to the use of recycled water in Havant Thicket.</p> <p>Regarding cost, Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history. It should be noted that Southern Water has temporarily suspended dividends to shareholders and has not paid dividends since 2017. Also, the £1.6 Billion investment funding received from Macquarie Asset Management has been paid to Southern Water Group and none of this amount has been paid to previous shareholders.</p> <p>Regarding the energy used, water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each</p> |

|           |          | <p>successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>Regarding storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. At local scale, we have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish. One of the complications with moving abstractions close to sea is the impact of tides on the duration of abstraction and water quality. We will be exploring them further for our next plan.</p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment.</p> <p>Regarding the viability of sea tankering, this option is no longer included in our plan.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| WRMP992   | <p>I want to notify you off my total opposition to the Sewage effluent recycling/toilet to tap plan at Havant Thicket Reservoir. I have many reasons and concerns, which I will fully explain.</p> <p>I live close to the Havant Thicket Reservoir site.I am a very concerned resident who has lived here for over 25 years. My elderly parents are not familiar with composing emails, otherwise they would have contacted you too.</p> <p>I am a Stakeholder on Havant Thicket Reservoir project after receiving a kind invitation from the CEO of Portsmouth Water a few years ago I intend to attend the meetings more regularly again in the New Year, as I have missed some due to family caring responsibilities. Two local residents and friends of mine are also members and have kept me updated on various details. Southern Water insist that they plans to reach Carbon net zero by 2050. This plan is utterly ludicrous as this plan is extremely Carbon heavy, energy intensive and environmentally damaging in lots of ways!</p> <p>I am sure it would be incredibly lucrative for both Southern Water and Portsmouth Water though, as NSIP's granted via DCO's attract huge amounts of money and are incredibly profitable for them both. I am concerned about the fact that the Southern Water customers are footing the bill through massive increases in their bills over the years. Ofwat have insisted that Portsmouth Water customers won't foot the bill, as agreed several years ago when the unique 80 year supply deal was struck between both water boards and signed off by them, therefore it appears that Portsmouth Water customers are protected from these increases. Hopefully, this agreement is set in stone.</p> <p>The cost of this scheme has already risen to £1.3 billion, which no doubt will continue to rise exponentially over the years if this horrendous scheme is approved! I have attended public meetings with Southern Water and Portsmouth Water and various events in the area designed to brainwash everyone that there is absolutely no alternative to this plan! The marketing teams are experts at dealing with the public and batting away relevant questions and concerns, like politicians. Nothing was answered in a satisfactory way, when I asked relevant questions and they were basically evaded. Nevertheless, I have done my own reserach as have many others, in a local environmental group, ai am a member of and none of us are NIMBY's.</p> <p>The amount of energy needed to build and run this facility will be immense and a huge drain on the National Grid!</p> <p>There is no benefit whatsoever to for our local area to the environment by building this environmental buffer lake. This was deliderately 'sold' to the local residents as a beautiful nature facility and lake akin to Petersfield lake. The slick marketing material made it look wonderful! Also originally everyone was told it would be a green leisure hub with water sports, bird watching, fishing and many other amazing facilities. There has been total destruction of over 14 hectares of ancient woodlands, not including the ephemeral trees, plants, flora and fauna bulldozed for all this at Havant Thicket, for something entirely different to what was promised Havant Borough Council and East Hants District Council! This was agreed as a Spring water fed reservoir only and this is why it was approved by them both!</p> <p>The Principal planning officer at the time who was in charge at both councils insisted any change of use would be decided by them at local level. However this was untrue as it was taken out of their hands as soon as the reservoir footprint had been agreed. Southern Water have gone over their heads to the government instead! They are objecting to this proposal for a complete change of use too.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Regarding carbon and energy, water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</p> <p>As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible.</p> <p>We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <p>Regarding the environment, our Environmental Impact Assessment is providing a rigorous and proportionate approach to assessing and managing the effects of the Project and we're ensuring that environmental considerations inform the Project's design. We have already embedded several measures at the early design stages of the Project to avoid or minimise potential environmental effects.</p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|           | <p>The excuse for this project has been to protect the precious chalk streams from oner extraction. These are the very same chalk streams that regularly receive raw sewage discharges. It was reported again on the local news programmes recently on television on this ongoing pollution issue.</p> <p>This sheme isn't needed as we have plenty of rainfall in the UK and Havant has an abundance of natural underground Springs, which is why reservoirs have been refused here in the past. We are not a desert nation that has no other choice! In Singapore, for example there is a huge consumption of bottled water and other places like Dubai to avoid the tapwater Dubai has one of the highest bottled water consumptions per head in the world with 275 litres per person, due to concerns about the health risks of reverse osmosis treated sewage effluent. This will happen here if the toilet to tap plan goes ahead. The PFAS forever chemicals and endocrine disrupting chemicals and hormones cannot entirely removed by reverse osmosis and not all Benzene a dangerous Carcinogen can be removed either.</p> <p>We will be the trial or 'guinea pig' area to see if it affects people's health detrimentally as this has never been done in the UK before! Unfortunately it will be hard to prove how people have got ill from ingesting the water it is not a gamble worth taking.</p> <p>If Southern Water got on with fixing the thousands of leaks this would not be needed at all. Rainwater can be captured by buliding several smaller reservoirs nearer to where they are needed in Southampton and Winchester and by using underground storage aquifers. Moving extractions up to the tidal limit will also make a difference.</p> <p>The cost of running this all is estimated at 3 to 5 million pounds a year as it has to run non stop all day every day throughout the year! We currently only collect 1% of rainfall for drinking water, this must change, building reservoirs to capture this is an obvious and simple solution. It is ridiculous to recycle toilet water when we have so much rain which leads to regular flooding. These rainwater reservoirs would reduce flooding!</p> <p>To justify this scheme every single, most unlikely hypothetical scenario has been used; massive population growth, (birth rates have declined dramatically this year actually), the most severe and extremely unlikely droughts and the most severe limits on river abstractions. This really helps to convince you they are right although it is obviously disengenuous! If a good proportion of the the leaks were fixed where 98.5 million lites of water a day are lost, this would never need to be considered!</p> <p>The brine by product will be incredibly damaging to the harbour and waterways that will result from this. I am also very concerned on the plan to bulid a huge new sewage works at Broadmarsh on an old laddfill site that is 13 metres deep. Pilie driving into this will cause leachate of so many toxic substances into the harbour and contaminate it so much. Also noxious gases will be released into the air. None of this should be disturbed, it's an environmental distaster we face if this is approved!!</p> <p>Please insist on environmentally solutions instead as I have suggested above and protect human health and nature from this.</p> | <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history. It should be noted that Southern Water has temporarily suspended dividends to shareholders and has not paid dividends since 2017. Also, the £1.6 Billion investment funding received from Macquarie Asset Management has been paid to Southern Water Group and none of this amount has been paid to previous shareholders.</p> <p>Regarding bills, the way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the The Hampshire Water Transfer and Water Recycling Project (HWTWRP) as well. The HWTWRP is one of the schemes we need to protect the globally important River Itchen and River Test chalk rivers. The scheme will reduce our reliance on these internationally protected rivers during drought and provide a more reliable and sustainable source of water in the future. The increase in customer bills in the first year is a recognition by Ofwat of the costs of developing this scheme, which will be highest in the first half of AMP8.</p> <p>Regarding planning consent for Havant Thicket, Southern Water's Gate 1 and Gate 2 submissions to its regulators in both 2020 and 2021 confirmed investigation of alternative options for both water recycling and water transfers involving Havant Thicket Reservoir. The water recycling proposals are not expected to impact the proposed recreational use of Havant Thicket reservoir.</p> <p>The HTR TCPA is for raw water, but our DCO will change the operational use of the reservoir so that it can store the mix of water that will be used with the HWTWRP. The Rapid G1 and G2 submissions are not related to the planning process.</p> <p>Our estimated cost for Havant Thicket Reservoir is included in our Water Resources Planning tables. We do not recognise the figure for £1.3 billion for the reservoir.</p> <p>Supplementing the reservoir with purified recycled water will create a new sustainable source of supply. The water recycling proposals are not expected to impact the proposed recreational use of the reservoir.</p> <p>The WRMP process is set out in primary legislation, within Defra directions and in guidance issued by the Environment Agency (EA), Natural England, Ofwat and Natural Resources Wales. We, Southern Water, have produced this WRMP24 in line with Directions and guidance issued by Defra and our regulators. We will continue to do so. Our plan has been produced in collaboration with other water companies within the South East as part of the Water Resources South East (WRSE) regional group. We provide annual reviews of our WRMP to regulators and produce an entirely new WRMP every five years. This process allows for changes to be made to the WRMP to account for new information and consultation</p> |

|-----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |          | <p>feedback. In rare cases, for example, where there are unresolved issues and substantial public interest exists the Secretary of State may call an inquiry or hearing.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers.</p> <p><a href="#">Our Business Turnaround Plan   Southern Water</a></p> <p>Regarding storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. At local scale, we have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>Customer insight locally and nationally shows broad support for water recycling. We don't expect customers to buy bottled water when the clean, wholesome water coming from their taps continues to meet strict UK water standards and is many hundreds of times cheaper.</p> <p>The advanced treatment processes used in water recycling are used around the world to remove nutrients, pharmaceuticals and other impurities. Reverse osmosis and other elements of the Full Advanced Treatment process provide robust removal of impurities including "forever chemicals" in the purified recycled water produced.</p> <p>Regarding the quality of recycled water, just as water across the country has its own distinct taste influenced by the geology of the local area, so the water taken from Havant Thicket reservoir may taste different from existing supplies due to the spring water being open to the elements, together with the addition of recycled water. However, the water at customers' taps will continue to meet strict drinking water quality standards and be wholesome to drink. We are working closely with international experts, regulators and environmental organisations to develop the plans and ensure this. For more information about water recycling, please visit the government website <a href="https://dwi.gov.uk/water-recycling/">https://dwi.gov.uk/water-recycling/</a></p> |

|-----------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |          | <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>We consider all options, regardless of size, as part of our options appraisal process. In a number of cases, we have considered different capacity variants of the same option. For example, in the case of HWTWRP, we considered water recycling plants ranging in size from 15MI/d to 60MI/d. Similarly, the desalination plans we have considered in the Central and Eastern areas vary in size from 10MI/d to 40MI/d. A number of these plant can be built in a modular fashion i.e. a smaller plant can be built initially but expanded later as the need for water increases. The size of the scheme ultimately selected in the plan represents, in our view, the overall best value for the customers and the environment in terms to being able to meet the anticipated demand, resilience to climate change and delivering Environmental Destination.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>Our supply area is classed as being under 'serious water stress' by the Environment Agency. Please see <a href="https://view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fassets.publishing.service.gov.uk%2Fmedia%2F60dd7f328fa8f50ab1d0128a%2FWater_stressed_areas_final_classification_2021.odt&amp;wdOrigin=BROWSELINK">https://view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fassets.publishing.service.gov.uk%2Fmedia%2F60dd7f328fa8f50ab1d0128a%2FWater_stressed_areas_final_classification_2021.odt&amp;wdOrigin=BROWSELINK</a></p> <p>We have considered multiple combinations of growth forecasts, climate change impacts and Environmental Destination. This was covered in Section 5 of our rdWRMP24 technical report. The range of supply-demand balance scenarios in Water Resource Zone (WRZ) as shown in Annex 11 to our rdWRMP24 technical report, covered both extremes i.e. the combination of high growth, high climate change impact and high Environmental Destination (supply-demand balance Situation 1) as well as the combination of low growth, low climate change impact and low Environmental Destination (supply-demand balance Situation 9).</p> <p>We have not based our plan on a single population forecast but have used a range of population forecasts to determine the nine future supply-demand balance scenarios that we have planned for (see Section 5.5.3 of the rdWRMP24 Technical Report). The estimates of future population growth range is from 34% to 7% growth at the company level between 2025</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>and 2075. The range of growth forecasts considered each of our WRZs is shown in Section 2 of Annex 7 that accompanied rdWRMP24 Technical Report. As part of our adaptive planning approach, we will track population growth and switch to the most appropriate supply-demand balance situation.</p> <p>All water companies in England and Wales are required to plan for a drought of a 1-in-500 year severity. This requirement is set by the government, not by water companies.</p> <p>A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations.</p> |
| WRMP993   | <p>Dear Sirs</p> <p>As a long time resident of Hayling Island, an elected member of the local council and a Southern Water bill payer, I am writing to express my strong objections to the Southern Water Resources Management Plan.</p> <p>My concerns are as follows:</p> <ol style="list-style-type: none"> <li>1. Lack of Consideration for Alternative Solutions: The current proposals have not adequately considered lower-cost and faster to market alternatives. The Effluent Recycling Scheme proposed for Havant is not going to result in a single drop of additional water for bill payers until 2035 at the earliest. The lack of investment over the previous decades has now made it even more imperative that speedy action is taken now. The UK water industry too often favours large-scale schemes over simpler, less capital-intensive solutions, localised solutions which can be replicated in multiple locations quickly and cheaply. Examples of alternatives include new boreholes and river abstraction close to the sea. Southern Water should explore solutions to store natural water from abundant winter rains for use during dry summers.</li> <li>2. Environmental Pollution: The effluent recycling scheme poses substantial environmental concerns, particularly regarding the discharge of concentrated reject water into Langstone Harbour and the wider Solent. Langstone Harbour enjoys a number of legal protections. This internationally important habitat is already under threat from years of pollution. The Environment Act asks us all to seek solutions that will benefit Nature. I ask you to ensure</li> </ol> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <ol style="list-style-type: none"> <li>1. Our plan is adaptive in nature. This means that we can switch schemes depending on the scale of population growth, climate change impacts and the amount of reduction in the volume of water we get from our existing sources. We do consider the risks in delivering the schemes selected in our plan and try to mitigate them as much as we can. Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</li> <li>2. Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our</li> </ol>          |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>that environmental protections for Langstone Harbour are held as high as those for the River Itchen and Test, they are all equally important. The construction phase involves deep tunnel shafts into an historic landfill site, whose harmful toxins pose significant risks to Langstone Harbour's delicate ecosystem.</p> <p>3. Energy Intensity: The proposed reverse osmosis solution for the [REDACTED] site is highly energy-intensive and has never been used at scale in the UK. This technology is generally deployed in hotter climates with large amounts of renewable energy. Additionally, the site is 40km from where the water is required, making the scheme a high-carbon solution with an annual running cost of over £3 million. The recycled effluent scheme is aimed to assist in times of drought, however in order to keep the pipeline sweet it will have to run continuously whether or not we are in a drought period. This means that during prolonged periods of rainfall pumping will still need to take place, in effect moving water between one site and another not for anyone to use but simply to keep the flow moving.</p> <p>4. Lack of Focus on Leakage: Southern Water needs a more ambitious program to reduce leakage. It has not met the commitment it pledged to OFWAT in its previous business plan. More focus should be made to incentivise Southern Water to fix their leakage issues. Currently, 3% of water taken from the environment is lost before reaching the treatment works, and a further 19% of treated water is lost in the distribution network. Southern Water has been slow to invest in advanced pressure management solutions which are relatively low cost and can be used to help reduce leakage. More focus should be placed on this and a catch up plan put in place to get Southern Water back on track.</p> <p>5. Deception Regarding Havant Thicket Reservoir: The Havant Thicket reservoir was sold to the public as an environmentally led resource, a world first reservoir fed from chalk aquifers. Mixing this with output from the Effluent Recycling Scheme will degrade the water quality without giving Portsmouth Water customers the opportunity to object as this process has been taken out of local authorities hands.</p> <p>6. Funding of the Hampshire Effluent Recycling Scheme: The cost of this scheme is enormous and will be debt-funded, which seems to be a backdoor enrichment of Southern Water shareholders. I believe the debt should be funded elsewhere, or the profits on the debt should be included in the profits shown by Southern Water as part of the scheme.</p> <p>7. Inadequate Public Consultation - Southern Water Customers who are not on the pipeline route have not been consulted on the Effluent Recycling Scheme. This means that a city the size of Portsmouth which will be affected by the disruption caused by the build phase, will be exposed to the potential harms of this scheme, will be drinking the water and paying the costs of this in their bills are completely oblivious to this proposal.</p> <p>I urge you to reject the current Southern Water plan and require Southern Water to develop a more sustainable plan that prioritizes the environment over profit.</p> <p>Sincerely,</p> | <p>decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations.</p> <p>3. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were. Water from the water recycling plant will be used all year round to supply Southern Water customers, following further environmental restrictions including abstraction limitations from Natural England's Common Standards Monitoring Guidance conditions. These conditions set new year-round flow targets for the River Itchen and proposed targets for future implementation on the River Test, reducing the water available, both in the summer and winter.</p> <p>4. The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>5. Regarding planning consent for Havant Thicket, Southern Water's Gate 1 and Gate 2 submissions to its regulators in both 2020 and 2021 confirmed investigation of alternative options for both water recycling and water transfers involving Havant Thicket Reservoir. The HTR TCPA is for raw water, but our DCO will change the operational use of the reservoir so that it can store the mix of water that will be used with the HWTWRP. The Rapid G1 and G2 submissions are not related to the planning process.</p> <p>6. The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> <p>7. Our consultation engagement with our customers and stakeholders is described in Annex 5 of our rdWRMP24 Technical Report. In addition to publishing the majority of our rdWRMP24 documents on our website, we arranged 8 roadshows across our supply area during October-November; 3 in our Western area, 2 in our Central area and 3 in our Eastern area. Southern Water staff were available at these roadshows to answer any questions on our rdWRMP24. Hard copies of our rdWRMP24 Technical Report and Non-Technical Summary of our plan were also available for attendees to view and take with them. In addition, we provided 5 area-specific webinars of 75 minutes duration each whereby we presented key features of our plan during the first 35-40 minutes with the remaining time allocated to Q&amp;A. We released a press release regarding the consultation, which was picked up by major newspapers; The Guardian and the Financial Times. We produced both targeted and non-targeted adverts on social media. We also publicised the consultation in our newsletter which went out to all of our customers. MPs, Stakeholders and previous responders were all directly emailed regarding the consultation.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Using Havant Thicket reservoir to store purified recycled water has been selected as the optimum way of making up a large part of the shortfall we face in Hampshire. Pumping 60 million litres of water a day into the reservoir will allow up to 90 million litres a day to be taken during a drought. Multiple options were considered during the options appraisal process that was carried out as part of the RAPID gated process to identify alternatives to West Southampton Coast desalination and the HWTWRP consistently scored higher than other options. It was approved by RAPID for adoption as the preferred Strategic Resource Option (SRO) to be progressed in Hampshire. Please see section 3.2 in our fdWRMP24 for more detailed reasoning on why West Southampton Coast desalination was not taken forward beyond RAPID Gate 2.</p> <p>The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history. It should be noted that Southern Water has temporarily suspended dividends to shareholders and has not paid dividends since 2017. Also, the £1.6 Billion investment funding received from Macquarie Asset Management has been paid to Southern Water Group and none of this amount has been paid to previous shareholders.</p> |
| WRMP996   | <p>It has come to our notice that there is a plan to use recycled effluent to top up the new reservoir at Havant thicket. The ecology of the new reservoir would be harmed as well as the infrastructure being extremely expensive when there are less expensive, less carbon heavy alternatives available.</p> <p>Rainwater collection is only 1% at present and efforts should be made to increase thus low percentage. Leakage is currently huge and should be addressed before investing in this plan.</p> <p>We urge you to use your power to force Southern Water to explore more environmentally friendly and economical alternatives.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|           |                                                                                                                                                                                                                                                                                                                                                                                | <p>having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</p> <p>As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible. We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <p>We have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>We have a dedicated team who scope and deliver natural solutions to reduce the water quality risks to our drinking water supplies, and deliver ecological resilience schemes as part of a suite of mitigation measures, including abstraction licence reductions, to address identified impacts from our abstractions. In AMP8 we are investing £90m on natural solutions, including habitat and biodiversity improvements, reduced risk of spread of invasive non-native species, in river enhancements, catchment management with the agricultural sector and Catchment Partnerships, chalk stream enhancement and SSSI management. This is a long term programme that started in AMP6, and natural solutions are embedded in our long term delivery plans. Regarding effects of recycled water on local ecology, purified recycled water is extremely clean. Water quality in the reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025.</p> |
| WRMP997   | From everything I read it seems absurd for Southern Water to spend such a huge amount of money on this "reverse osmosis" plan. I have so little faith in this water authority that I fear anything could go wrong in building and maintaining this facility. I gather from experts that there are several much cheaper and equally effective ways of topping up the reservoir. | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Regarding the quantification of cost, yes, we calculate capital, operational and carbon costs for each option. These are presented in the Water Resources Planning tables that accompany</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|           | PLEASE do not let this current proposal go through.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>our plan and are scrutinised by Ofwat as part of our Business Plan. Our capital programmes are delivered in line with our regulatory commitments and operational needs.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers.</p> <p><a href="#">Our Business Turnaround Plan   Southern Water</a></p> <p>The Environment Agency will determine the permits for the release of purified recycled water into the reservoir and will monitor them. The Environment Agency ensure compliance of all discharges.</p> |
| WRMP998   | <p>I am emailing you to ask you to make sure that this dangerous, ill-conceived, environmentally &amp; wildlife damaging &amp; community disrupting monstrosity is not built.</p> <p>This project has NOT been rigorously investigated and after all their pushing of this proposal, they are only just doing the CCT testing &amp; it is so far proving that this area is not suitable for this proposal (but I understand they intend to go ahead anyway despite local objections)</p> <p>Our locality around this area has always been prone to flooding &amp; this has worsened in recent years, due to a variety of reasons, (not least of all, mismanagement &amp; failure to look to the future by increasing sewage capacity &amp; fixing of leaks by Thames Water. )</p> <p>Thames Water have NOT looked ahead to what is needed with the tens of thousands of new houses in estates built all over Grove, Wantage, Hanney, Steventon, Drayton &amp; Abingdon, not mention the outlying villages with smaller estates being built. These are all largely built on farmland &amp; floodplains.</p> <p>The water table in this whole area is quite high (for example, in the Grove Cemetery, the graves can fill with water overnight before the coffin can be put in the hole)</p> <p>This proposed reservoir will disrupt many small local watercourses vital for drainage &amp; can only worsen the flood risk, plus it is now estimated that the weight of this thing will actually raise the height of the water table by up to a metre.</p> <p>The narrow roads in this rural area are full of potholes. The edges are crumbling &amp; it is not fit for heavy lorries &amp; machinery.</p> <p>Thames Water could increase capacity if they had a rigorous &amp; effective ongoing plan to maintain &amp; replace pipework alongside an effective responsive system of fixing leaks ( of course actively looking for &amp; repairing leaks during the course of "routine maintenance" for the past 20 years might also have helped conserve water)</p> <p>Displacement of wildlife, local watercourses &amp; the local chalk stream, will cause harm, not to mention farmland lost &amp; our roads &amp; communities adversely impacted.</p> <p>The albeit small risk of the reservoir bursting would be catastrophic.</p> | <p>Thank you for reviewing the Southern Water rdWRMP24 and providing feedback. Your comments relate to sites within the Thames Water area, therefore should be directed to Thames Water, we are unable to respond to these as part of this consultation process.</p> <p>As part of public consultation on SESRO in summer 2024, a number of documents were issued and clearly mentioned the planned capacity for the reservoir (150 million cubic meters). The documents are available on the Thames Water website. See, for example,</p> <p><a href="#">South East Strategic Reservoir Option (SESRO) - Thames Water Resources Management Plan</a></p>                                                                                                                                                                                                                                                                                                              |

|           | <p>Finally, I would add that Farnoor reservoir is not full &amp; cannot be filled by water from the Thames ( where this reservoir is also to filled ) because it is so polluted with raw sewage (all dumped in there by Thames Water!!!)</p> <p>Thames Water, as we all now know, is corrupt at it's core. They have proven themselves to be greedy, self seeking &amp; concerned ONLY with profit for shareholders &amp; investors. Evidence shows they are at the very least incompetent &amp; unable to deliver a service that has consumers benefit at it's core. Quite the reverse. They should increase sewage treatment capacity, fix the leaks &amp; stop polluting our environment. So NO! NO! NO! To Thames (incompetent, untrustworthy &amp; much despised) Water.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| WRMP999   | <p>Defra should only look at solutions that don't require high levels of energy consumption, nor should they be letting Southern Water run with the ball. Anyone with a brain knows that the conversion of sewage into drinking water is problematic and nobody wants it. This is also expensive which is why Southern Water plans to increase customers' water bills. The whole thing is scandalous. We are a democracy and we shouldn't be dictated to by the likes of Southern Water or anyone else. We the people have spoken against this private, ill-conceived plan. It's the same as raising your taxes. Why can't you just separate drinking water from sewage water in all homes, particularly new ones. This is another example of "follow the money".</p>             | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>The National Framework, Water Resource Planning Guideline and other supplemental policies all recognise the need for water resource plans to not only secure a water supply but to also add to wider environmental and societal benefit.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years, but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife.</p> <p>This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling and desalination. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society. Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</p> <p>As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible.</p> |

| Reference | Feedback | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|           |          | <p>We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050.</p> <p>The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy. We provide non-potable supplies to some large industrial users. However, it is not feasible for us to provide dual supplies, potable and non-potable, to each of our customers. This will also require the entire housing stock across our supply area to undergo modifications in internal plumbing. We do not consider this to be a realistic option. We are working with developers to recycle as much water as possible on new developments at the site level.</p> <p>Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers.</p> <p><a href="#">Our Business Turnaround Plan   Southern Water</a></p> <p>Regarding safety, no untreated wastewater will enter the reservoir. The HWTWRP scheme uses global best practice with a multi-barrier approach and monitoring to ensure that the water quality is exceptional when transferred to the reservoir.</p> <p>The recycled water will be subject to the same stringent quality checks and requirements as other drinking water sources. We do not have any evidence to suggest that recycled water poses a higher risk than in other drinking water supplies.</p> <p>Customer insight locally and nationally shows broad support for water recycling. We don't expect customers to buy bottled water when the clean, wholesome water coming from their taps continues to meet strict UK water standards and is many hundreds of times cheaper.</p> <p>Regarding bills, the way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Regarding cost, we carry out an options appraisal exercise when we update our plan every 5 years. This exercise is usually carried out by an external consultant and looks at new options as well as options that were previously considered but were not taken forward for a variety of reasons. Cost is one of the factors considered in the options appraisal process but is not the only determining factor. We also need to look at factors such as volume of water that an option can provide, its resilience to climate change, environmental impact etc. in addition to capital and operating costs. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>Regarding profit, Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history. It should be noted that Southern Water has temporarily suspended dividends to shareholders and has not paid dividends since 2017. Also, the £1.6 Billion investment funding received from Macquarie Asset Management has been paid to Southern Water Group and none of this amount has been paid to previous shareholders.</p> |
| WRMP1000  | <p>Southern Water Revised Draft WRMP2024 Consultation</p> <p>I write in response to Southern Water's consultation on the revised draft WRMP 24 and specifically the Sussex North Water Resource Zone (SNZ) within its Central Area and more specifically the reliance, if any, on groundwater abstraction at [REDACTED] Pulborough, on behalf of Crest Nicholson, who have land interests in the affected WRZ.</p> <p>1. Water Industry Act Obligations</p> <p>Under the Water Industry Act (WIA) there is a statutory framework in place that places a duty on the water undertaker to provide supplies of water to persons who demand them (s37 WIA). In addition, Southern Water has the duty to supply potable water without causing harm to the environment, specifically, for these purposes, the Arun Valley SPA/SAC/Ramsar sites, which are protected under the Conservation of Habitats and Species Regulations 2017 (the Habitats</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback</p> <p>Your comments on our obligations within the Water Industry Act are noted. At no point have any requests for supply for developments been refused by Southern Water, We take our duty to protect the environment very seriously through compliance with our licences and our future planning processes such as our WRMP.</p> <p>1) Natural England applied the precautionary principle in issuing its Position Statement on Water Neutrality in the Sussex North WRZ. At the time of the introduction of the Position Statement, no link had been demonstrated between the groundwater abstraction at Pulborough and any impacts on the sensitive ecosystems downstream of the abstraction. We commissioned a study in 2021 to investigate any impacts of our groundwater abstraction at Pulborough on the downstream ecosystems. The Environment Agency, Natural England, Royal Society for the Protection of Birds (RSPB)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|           | <p>Regulations).<br/>This is a two-fold duty, the first is to supply the water, and the second is to do so without causing harm to the environment, specifically including the Arun Valley sites.</p> <p>2. Natural England Position Statement:</p> <p>Natural England have identified through their Position Statement in September 21, that a potential linkage between groundwater abstraction at [REDACTED]/Pulborough and the Arun Valley sites cannot be excluded beyond reasonable scientific doubt. Consequently, they are not able to exclude the potential for adverse impacts at these habitat sites associated with groundwater abstraction from [REDACTED]/Pulborough.</p> <p>3. Voluntary reduction in groundwater abstraction</p> <p>In response to Natural England's concern, the Environment Agency accepted a voluntary reduction by Southern Water to reduce abstraction from their historic level of 13MI/d out of the permitted 36MI/d to a rolling average of 5MI/d.</p> <p>4. The Sustainability Review</p> <p>The EA responded by commissioning a Sustainability Review of the [REDACTED]/Pulborough groundwater abstraction which is due to report in March 2025. That will be followed by action, if necessary, by the EA under Section 52 of the Water Resources Act (WRA), which itself will be subject to an Appropriate Assessment under Regulation 63 of the Habitats Regulations.</p> <p>5. The Current Position</p> <p>Natural England have not updated their Position Statement and are continuing to advise local planning authorities to insist on water neutrality until the Environment Agency have established the acceptable levels, if any, of groundwater abstraction at [REDACTED]/Pulborough and have acted accordingly.</p> <p>6. The WRMP Process</p> <p>The WRMP process is to demonstrate how sustainable supplies of water can be provided for projected need without constraining growth (see 6.3 of WRPG2) in a manner consistent with the Habitats Regulations (see 9.4.3 of WRPG).</p> <p>7. The WRMP must not rely on water neutrality</p> <p>In essence, water neutrality is an insistence that those who have a right to connect and receive a supply under the WIA duties imposed on the Water Undertakers must first establish that they will have no net increase in demand for water from the water undertakers. In the context of a</p> | <p>and Sussex Wildlife Trust are involved in the study. The results are expected in summer 2025.</p> <p>We have voluntarily reduced our groundwater abstraction at Pulborough while the study is ongoing. It would be premature to make a final decision on the status of the Pulborough groundwater abstraction until the study is completed and the outcomes are known.</p> <p>The scale of reductions in our groundwater abstractions, if any, will depend on the outcome of the study mentioned above. If a link between our groundwater abstraction at Pulborough and deterioration of downstream ecosystems is established, it may not necessarily lead to a revocation of our groundwater licence if the impact can be mitigated by reducing the abstractions. Should the policy and requirement for Water Neutrality continue to be in place following the conclusion of the investigations at Pulborough, we will continue to engage with all relevant stakeholders and customers in Sussex North WRZ on the water efficiency measures we will be implementing to enable growth.</p> <p>2) Outside of Sussex North we support the concept of water neutrality, which existed prior to the Position Statement in Sussex North, as a method for developing efficiency in demand management, this is discussed in Annex 22 of our draft WRMP documents. <a href="#">Annex-22 Water-Neutrality.pdf</a></p> <p>We note your comment.</p> <p>To your point regarding reliance on water neutrality, Southern Water does not propose water neutrality in Sussex North as an alternative to fulfilling our duties and will continue to ensure sufficient water resources are available. The Position Statement issued by Natural England is in reaction to specific conditions on the site, which is not related to the capacity of water in the networks which developers would wish to connect to. Any developer with appropriate planning consent from the Local Planning Authority (LPA) will be able to connect as normal. We do not influence the decision of the LPA on whether planning consent should be granted.</p> <p>7) Specifically with regard to the need to make provision for a scenario of zero groundwater abstraction at Pulborough, we have not included that scenario in the Plan, because we are awaiting the results from the Sustainability Study due to complete at the end of March 2025. Those results will then need to be validated by the Environment Agency. The output from the Study will then be used to guide discussions with the Environment Agency about future levels of sustainable abstraction at Pulborough. We will expand on the results of the sensitivity analysis around groundwater abstractions at Pulborough to illustrate the changes in our strategy should the outcomes from the investigations warrant a reduction in or revocation of groundwater abstraction at the site.</p> <p>8) Please see answer to (8) above.</p> |

|           | <p>WRMP, reliance on water neutrality by the Water Undertaker is an abnegation of the Undertaker's duties under the WIA regime.</p> <p>8. Consequences of the Sustainability Review</p> <p>In the Sussex North WRZ the EA Sustainability Review will determine what, if any, groundwater abstraction at [REDACTED]/Pulborough is sustainable and consistent with protecting the Arun Valley sites. That could be all of the current permitted licence levels, some of it, to be determined, or none of it. If the sustainability review concludes there is doubt remaining as to the potential impact, Reg 63 (5) of the Habitats Regulations will require no abstraction. This will be known from March 2025. Consequently, the WRMP must make provision, as of now, for a scenario of zero groundwater abstraction at [REDACTED]/Pulborough.</p> <p>9. The need to consider zero abstraction from [REDACTED]/Pulborough</p> <p>Section 7 of the rdWRMP Technical Report3 (under section 7.3.2 '1. Changes that resolve supply-demand balance through an alternative solution...include:</p> <ul style="list-style-type: none"> <li>Reducing Pulborough groundwater DO in SNZ from 13MI/d to 5.55MI/d from 2025 followed by full revocation from 2030-31 (see S11 and S23 in Table 7.69)' refers to scenarios of reduction of reliance at [REDACTED]/Pulborough including reducing to zero from 2031.</li> </ul> <p>As far as we can discern, the rdWRMP doesn't assess a scenario of zero abstraction from 2025. In the light of 8 above, the WRMP will need to do this if it is to fulfil its function.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| WRMP1001  | <p>I write with regards to the proposed recycling of wastewater effluent into Havant Thicket reservoir.</p> <p>Whilst the technology being proposed has been demonstrated in countries such as Singapore and California these are quite energy intensive approaches and the efficiency in removal of some shorter chain anthropogenic compounds such as PFAS has not been demonstrated sufficiently as safe. For example, new epidemiological data from Singapore puts PFAS in the population as relatively high compared to other SE Asian countries and their food standard agencies consider PFAS in seafood as low. Those with higher PFAS have lower fertility and higher birth defects compared to those with lower PFAS in their blood. This would indicate that PFAS maybe present in some drinking water especially when these studies found no differences in ethnicity which links to diets.</p> <p>Whilst desalination and effluent recycling may well be required due to climate change in South East I do not think the better use of less carbon intensive approaches such as further reservoir development in the area has been fully explored which could help also with nature targets and green spaces and ease pressure on spring fed chalk streams.</p>                                                                                                                                                                                                                                                                                                                                   | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water. All of the hormones tested in trials conducted by SWS (testosterone, progesterone, estriol and estrone) returned a non-detect result. Although it is true that not all the pharmaceuticals and personal care products (PPCPs) are rejected by reverse osmosis membranes, our results recorded concentrations an order of magnitude, or lower, than found in wastewater.</p> <p>Regarding PFAS, there are currently no statutory standards for PFAS in drinking water England and Wales, nor is there a World Health Organisation guideline value. The DWI has taken a precautionary approach and produced tiered guideline values for water companies to adhere to with a guideline value of 0.1 micrograms per litre for the sum of 48 named PFAS, which is equivalent to 0.1 parts per billion.</p> <p>With regard to your specific point regarding epidemiological evidence, Southern Water must comply with stringent standards established by our regulators which take such evidence into account, the Drinking Water Inspectorate (DWI) would be able to provide further detail. For</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>more information about the DWI and how it regulates the quality of drinking water, please visit the government website <a href="https://dwi.gov.uk/">https://dwi.gov.uk/</a></p> <p>Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). Reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| WRMP1002  | <p>We cannot believe that the idea of using this questionable recycled water, entering the reservoir for a main source of drinking water, when it is quite possible to adopt a lesser expensive alternative via the "" raw water"" source from the company's local chalk-fed freshwater springs. The alternative plans incur a greater cost and works against our efforts to achieve "" net zero carbon "" figures.</p> <p>If this is allowed to go ahead the ecology of the reservoir will be irreversibly damaged for future generations.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</p> <p>As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible.</p> <p>We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050.</p> <p>The Hampshire Water Transfer and Water Recycling Project (HWTWRP) is one of the schemes we need to protect the globally important River Itchen and River Test chalk rivers. The scheme will reduce our reliance on these internationally protected rivers during drought and provide a more reliable and sustainable source of water in the future.</p> <p>Regarding effects of recycled water on the ecology of Havant Thicket reservoir, purified recycled water is extremely clean. Water quality in the reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025.</p> |

| WRMP1003  | <p>We are writing to strongly object to the above proposal to implement this scheme at the Havant Thicket reservoir.</p> <p>This is unnecessary, dangerous and Southern Water really cannot be trusted.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Thank you for reviewing our rdWRMP24 and providing feedback. We note the objection to the use of recycled water in Havant Thicket.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers:</p> <p><a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| WRMP1005  | <p>I wish to lodge May concerns regarding the above proposed plan by Southern Water.</p> <p>The cost of the scheme would be better spent on a more sustainable safer solution. There has been inadequate considerations of the impact on health and the environment.</p> <p>Southern Water have a responsibility to demonstrate that health and the environment are its priority - this scheme falls short of that.</p> <p>Plans which do not consider reducing energy use should not be accepted. Poor solutions in one area of the country will be mirrored in others.</p> <p>Water is a precious resource which is a fundamental element of the UK household and outdoor environment, its purity has already been impacted negatively.</p> <p>I object to this scheme and ask that another more sustainable safe solution be requested.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Regarding the potential to develop small sustainable schemes, we have to meet very challenging demand management and Environmental Destination targets set by the Government. The resulting scale of supply-demand balance deficits requires us to be ambitious as well as innovative to meet future challenges. Environmental sustainability is a key criterion for including options in our plan, regardless of the size of the option. Environmental sustainability is a key criterion in our options appraisal process. This will continue to be the case for WRMP29.</p> <p>As a major abstractor of water in the South East for public supply, and with responsibility for the conveyance of wastewater from homes and businesses for treatment before it is returned to rivers or sea, Southern Water plays a critical role in carrying out these duties whilst protecting and enhancing the environment. Further information and reports on how we achieve this can be found on our website <a href="https://www.southernwater.co.uk/about-us/environmental-performance/protecting-and-improving-our-environment/">https://www.southernwater.co.uk/about-us/environmental-performance/protecting-and-improving-our-environment/</a></p> <p>Water recycling is widely used around the world to create a new source of supply that means less water needs to be taken from the environment supporting wildlife, particularly in a drought. Regarding effects of recycled water on the chemistry of Havant Thicket reservoir, purified recycled water is extremely clean. Water quality in the reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025.</p> |
| WRMP1006  | <p>Trying to understand the complexities of water supply over such a large area with very different catchment areas is extremely difficult for the lay person. Data in the consultation documents is confused with various demand figures and dates quoted none of which can be clearly followed through and all of which seem to take a worst-case scenario.</p> <p>We are presented with a single option of either wastewater recycling or saltwater recycling, both of which are highly capital intensive with high running costs and even higher financing costs it would seem, and with concentrated polluting discharges to the sea.</p>                                                                                                                                                                                                 | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>The information provided in many of the documents is very technical with many requirements set out in statutory process and supporting guidance. As this is unavoidable we produced a non-technical summary document for those seeking a high level understanding of our plan. You can view the publicly available documents on the link below.</p> <p><a href="https://waterresources.southernwater.co.uk/find-out-more/">https://waterresources.southernwater.co.uk/find-out-more/</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|           | <p>The targets set of 1:200-year limit by 2030s and 1:500-year limit by 2040s with no domestic drought orders up to those limits is in my view over onerous; tries to predict too far into the future, and forces the water company into drastic non environmentally sustainable solutions at the expense of developing more sustainable options in the medium term.</p> <p>The approach taken by DEFRA and the EA for Adaptable Pathways for sea defence would seem a better way to approach the uncertainties inherent in supply side water demand and climate change, rather than trying to look up to 70+ years ahead in one go.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>We have considered multiple combinations of growth forecasts, climate change impacts and Environmental Destination. This was covered in Section 5 of our rdWRMP24 technical report. The range of supply-demand balance scenarios in Water Resource Zone (WRZ) as shown in Annex 11 to our rdWRMP24 technical report, covered both extremes i.e. the combination of high growth, high climate change impact and high Environmental Destination (supply-demand balance Situation 1) as well as the combination of low growth, low climate change impact and low Environmental Destination (supply-demand balance Situation 9).</p> <p>Both desalination and water recycling inevitably use more energy and are subsequently more expensive to operate than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were. The drawbacks of any option have to be considered in view of the benefits it delivers. We have excluded desalination options in cases where drawbacks outweigh benefits or where the environmental challenges cannot satisfactorily be overcome.</p> <p>Our regulatory guidance specifies that we plan to get to a 1 in 200 and then a 1 in 500 year drought resilience. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of aquatic plants and wildlife. This means that Southern Water now need to look at water supply and storage options that have not been traditionally used, such as water recycling and desalination. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society.</p> |
| WRMP1007  | <p>I wish to object to Southern Water's water management plan for the following reasons</p> <p>This solution is a top-heavy, over-engineered and energy-intensive project designed to make maximum profit for Southern Water rather than make best use of natural water. Not only are the costs huge, but the project, with 24/7, 365 days a year pumping requirement, does nothing towards a sustainable energy future.</p> <p>This scheme does nothing about the problem of sewage discharges into our harbours – indeed, by building the water recycling plant on land that is an historic landfill, we further increase the problem of environmental damage from our water industry. Rejected water from the water recycling plant is even more contaminating than the sewage already regularly dumped in the harbours.</p> <p>This is a hugely expensive project, and greener, more sustainable and cheaper alternatives have been discounted or not properly investigated. One suspects because they do not make as much profit for the company. There needs to be consultation on the whole range of options for water security.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history. It should be noted</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

----------------------------------------------------------------------|
|           | <p>Southern Water do not have a good reputation in terms of water management. Their constant dumping of sewage into our harbours quite rightly angers everybody and their ability to manage a project such as this with no accidental contamination is to be highly questioned. Indeed, people will turn to bottled water rather than use this type of tap water, creating even more plastic waste.</p> <p>This scheme does nothing about the problem of sewage discharges into our harbours – indeed, by building the water recycling plant on land that is an historic landfill, we further increase the problem of environmental damage from our water industry. Rejected water from the water recycling plant is even more contaminating than the sewage already regularly dumped in the harbours.</p> <p>We are not a drought-ridden country. Recent flooding in many parts indicate this. Our challenge is to capture and store winter water for use in dry summers. The building of reservoirs and confined aquifers would do this, as well as help to alleviate flooding in at risk areas.</p> <p>Another possible solution that is not adequately considered is to move river abstractions to the tidal limit on the rivers Itchen and [REDACTED]. This has the effect of protecting the freshwater sections of the rivers and restoring natural flows. This is much simpler, and an added benefit is that because it is much closer to water treatment works and so requires fewer kilometres of pipeline.</p> <p>Another part of the solution to water supply is for Southern Water to address the phenomenal wastage of water through leaks. Customers are currently paying for SW to lose a fifth of the water that they collect.</p> <p>We are searching for ways of reducing our carbon footprint and address climate change and this project does neither, even though there are many ways we can resolve our water supply issues whilst addressing both these issues.</p> | <p>that Southern Water has temporarily suspended dividends to shareholders and has not paid dividends since 2017. Also, the £1.6 Billion investment funding received from Macquarie Asset Management has been paid to Southern Water Group and none of this amount has been paid to previous shareholders.</p> <p>Water from the water recycling plant will be used all year round to supply Southern Water customers, following further environmental restrictions including abstraction limitations from Natural England's Common Standards Monitoring Guidance conditions. These conditions set new year-round flow targets for the River Itchen and proposed targets for future implementation on the River Test, reducing the water available, both in the summer and winter.</p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations.</p> <p>Our Water Resources Management Plan covers our plan for provision of drinking water. Our treatment processes are designed to treat the water quality found in the water sources we rely upon. For further information on sewage treatment please refer to our Drainage and Wastewater Management Plan which you can find here:</p> <p><a href="https://www.southernwater.co.uk/about-us/our-plans/drainage-and-wastewater-management-plans/">https://www.southernwater.co.uk/about-us/our-plans/drainage-and-wastewater-management-plans/</a></p> <p>Customer insight locally and nationally shows broad support for water recycling. We don't expect customers to buy bottled water when the clean, wholesome water coming from their taps continues to meet strict UK water standards and is many hundreds of times cheaper.</p> <p>Our supply area is classed as being under 'serious water stress' by the Environment Agency. Please see:</p> <p><a href="https://view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fassets.publishing.service.gov.uk%2Fmedia%2F60dd7f328fa8f50ab1d0128a%2FWater_stressed_areas_final_classification_2021.odt&amp;wdOrigin=BROWSELINK">https://view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fassets.publishing.service.gov.uk%2Fmedia%2F60dd7f328fa8f50ab1d0128a%2FWater_stressed_areas_final_classification_2021.odt&amp;wdOrigin=BROWSELINK</a></p> |

|           |          | <p>Regarding storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. At local scale, we have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives. A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish. One of the complications with moving abstractions close to sea is the impact of tides on the duration of abstraction and water quality. We will be exploring them further for our next plan.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible.</p> <p>We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| WRMP1008  | <p>I wish to register that I am not in favour of Southern Water's Draft Water Resource Management Plan. I believe DEFRA should demand a far more sustainable plan, one that better protects the environment and contributes to mitigating the effects of climate change.</p> <p>Here are my reasons for asking DEFRA to reject Southern Water's plans.</p> <p>Using tankers to ferry water from Norway to the Southampton will only add to the levels of greenhouse gases and result in increasing the rate of climate change. Southern Water should be a major contributor to reducing CO2 and function as a beacon for others to follow. Building and operating centres for the recycling water are extremely expensive and consume lots of energy. This runs contrary to the need for ALL to us less energy. With the seen effects of increased rainfall and flooding due to climate change, Southern Water should concentrate on collecting and storing this excess water underground for use during the drier summer months.</p> <p>The cost of building the expensive water recycling centres will result in increasing water bills for Southern Water customers, an increase which will be hard to bear in these difficult financial times.</p> <p>Southern Water's image is not great. Instances of water contamination and network failures resulting in disruption and flooding are regularly reported in the local news. My confidence in Southern Waters ability to deliver major infrastructure projects is low. Especially in Havant where Southern Water plan to build a new water recycling centre on an old tip, a tip which the local authority has concerns about contaminants leaching into the nearby significantly sensitive environment of Langstone Harbour.</p> <p>There are alternatives to water recycling which are less costly and can be delivered years before any new water recycling scheme comes on stream. One of these would be to move the point of extraction from chalk streams from near the source to near the mouth. This would improve water levels in these streams and continue to permit extraction at near current levels.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years, but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling and desalination. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society.</p> <p>Regarding the environmental impacts of sea tankering, this option is no longer included in our plan.</p> <p>Water recycling inevitably uses more energy and is subsequently more expensive to operate than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact. As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible. We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24.</p> <p>We aim to deliver net zero carbon by 2050 and we are expanding our carbon accounting processes to measure the impact of our capital delivery programme. We recognise that carbon may be significant from this option however, due to the required transport methods</p> |

| Reference | Feedback | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |          | <p>and temporary nature of the option. We will continue to assess the carbon footprint of this option and balance it against the environmental benefit of protecting the River Test in times of drought.</p> <p>A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>The Hampshire Water Transfer and Water Recycling Project (HWTWRP) is one of the schemes we need to protect the globally important River Itchen and River Test chalk rivers. The scheme will reduce our reliance on these internationally protected rivers during drought and provide a more reliable and sustainable source of water in the future. The increase in customer bills in the first year is a recognition by Ofwat of the costs of developing this scheme, which will be highest in the first half of AMP8. The National Framework, Water Resource Planning Guideline and other supplemental policies all recognise the need for water resource plans to not only secure a water supply but to also add to wider environmental and societal benefit.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| WRMP1009  | <p>We believe Southern Water's first priority should be tackling the sewage release crisis. Once this is done, it will have a big beneficial effect on the quality of water in our rivers.</p> <p>We understand that water will become increasingly scarce in the future and we therefore support the original Portsmouth Water Reservoir project to enable the capture of surplus rainfall in the winter months so that it may be utilised in the summer months to top up the water supply. Luckily, in this location we get plenty of rainfall annually and this is likely to be ongoing. A priority for all water companies, and Southern Water in particular, should be solutions which store more free natural water for use in dry summers. To achieve this we believe there are greener and cheaper solutions, such as better use of aquifers and also creating more reservoirs. We don't believe these options have yet been properly investigated.</p> <p>We are concerned that the current mixed water solution proposal is prohibitively expensive both in terms of construction and perhaps more importantly ongoing running costs. Already costs have been growing exponentially. Other environmental concerns are that more reject water which is poisonous to the environment will be pumped into Langstone Harbour. We are also worried about the impact on Langstone Harbour from gas emissions due to building on a landfill site.</p> <p>We believe that in years to come Portsmouth Water customers will also be impacted. In times of drought or emergencies, or maintenance periods, we think Portsmouth Water customers will also receive the recycled water from the reservoir. A significant concern is that the recycled drinking water will taste different from the aquifer water that we currently enjoy. This will encourage more people to buy bottled water or invest in filter water cartridges which are both very bad for the environment.</p> <p>We and the general public at large have lost trust in Southern Water for well documented reasons which led to the current disastrous sewage crisis. We are therefore most concerned that Southern Water will be self-regulating the discharge from the WTP into the reservoir. Monitoring of these flows needs to be completely independent of Southern Water. The current plan is unacceptable.</p> <p>Conclusion</p> <p>We worry that this project could prove to be a white elephant whilst other cheaper options to use natural water supplies have not yet been sufficiently investigated. We think this is a high-cost solution both in terms of construction costs, environmental damage and ongoing energy costs.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our supply area is classed as being under 'serious water stress' by the Environment Agency. Please see <a href="https://view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fassets.publishing.service.gov.uk%2Fmedia%2F60dd7f328fa8f50ab1d0128a%2FWater_stressed_areas_final_classification_2021.odt&amp;wdOrigin=BROWSELINK">https://view.officeapps.live.com/op/view.aspx?src=https%3A%2F%2Fassets.publishing.service.gov.uk%2Fmedia%2F60dd7f328fa8f50ab1d0128a%2FWater_stressed_areas_final_classification_2021.odt&amp;wdOrigin=BROWSELINK</a></p> <p>Regarding storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. At local scale, we have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>The Hampshire Water Transfer and Water Recycling Project (HWTWRP) is one of the schemes we need to protect the globally important River Itchen and River Test chalk rivers. The scheme will reduce our reliance on these internationally protected rivers during drought and provide a more reliable and sustainable source of water in the future. The increase in customer bills in the first year is a recognition by Ofwat of the costs of developing this scheme, which will be highest in the first half of AMP8.</p> <p>A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations.</p> <p>Regarding the quality of recycled water, just as water across the country has its own distinct taste influenced by the geology of the local area, so the water taken from Havant Thicket reservoir may taste different from existing supplies due to the spring water being open to the elements, together with the addition of recycled water. However, the water at customers' taps will continue to meet strict drinking water quality standards and be wholesome to drink. We are working closely with international experts, regulators and environmental organisations to develop the plans and ensure this. For more information about water recycling, please visit the government website <a href="https://dwi.gov.uk/water-recycling/">https://dwi.gov.uk/water-recycling/</a></p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and</p> |

|           | <p>As far as we are aware, there has been little public consultation about the acceptability of the proposed project and no scrutiny of any alternative cheaper and more environmentally beneficial options.</p> <p>We believe that building more reservoirs would be a much better solution than building the effluent recycling scheme.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>Our consultation engagement with our customers and stakeholders is described in Annex 5 of our rdWRMP24 Technical Report.</p> <p>In addition to publishing the majority of our rdWRMP24 documents on our website, we arranged 8 roadshows across our supply area during October-November; 3 in our Western area, 2 in our Central area and 3 in our Eastern area. Southern Water staff were available at these roadshows to answer any questions on our rdWRMP24. Hard copies of our rdWRMP24 Technical Report and Non-Technical Summary of our plan were also available for attendees to view and take with them. In addition, we provided 5 area-specific webinars of 75 minutes duration each whereby we presented key features of our plan during the first 35-40 minutes with the remaining time allocated to Q&amp;A.</p> <p>We released a press release regarding the consultation, which was picked up by major newspapers; The Guardian and the Financial Times. We produced both targeted and non-targeted adverts on social media. We also publicised the consultation in our newsletter which went out to all of our customers. MPs, Stakeholders and previous responders were all directly emailed regarding the consultation.</p>                                                                         |
| WRMP1010  | <p>I have many concerns with Southern Water's WRMP, please can you stop the current plans</p> <p>The ongoing focus on recycled effluent starts in a deficit-based mode of thinking, requiring ongoing unsustainable inputs (chemicals, energy and carbon emissions, long distances and unclear water quality standards). It is said a problem cannot be solved with the same kind of thinking which created it, which requires a focus on root causes, application of the precautionary principle, prevention of further unintended consequences, long-term thinking and climate and nature literacy. I do not see these evident in the current proposal and would be willing to help build these skills and competencies in your teams who are experts in contemporary water management, yet will need to develop themselves for future water resilience.</p> <p>Please can you start with a focus on water quality, it may be that whole life costing and life cycle analysis offer you a way of understanding the best options now. Please adopt the hierarchy approach (used in waste and energy) which prioritises actions for:</p> <ul style="list-style-type: none"> <li>-Conservation/reduction in demand (first) - to encourage consumer behaviours to reduce water demand; to distinguish between potable and non-potable use; in particular to review and reduce commercial and large scale use of drinking water for non-potable uses;</li> <li>-Efficiency (second) - to prevent and reduce supply side leakages and other wasteful practices; to encourage consumer leakage reduction/waste reduction through diversion of grey water/rainwater for non-potable uses.</li> <li>-Renewable or sustainable resources (third) - rainwater capture -domestic scale, commercial and your own aquifer and reservoir storage; encourage and scale up grey water reuse for non-potable uses with largest users; with predicted increased precipitation and droughts, this makes</li> </ul> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>The Havant Thicket Reservoir was selected in WRMP19, has been through a separate consultation process and we are progressing with its delivery. It is not a scheme introduced in WRMP24. The cost for the Havant Thicket Reservoir is included in the Water Resources Planning tables that accompany our plan. Annex 12 to our rdWRMP24 listed all options considered for WRMP24, including those that were not taken forward for a more detailed assessment (Section 3 of Annex 12).</p> <p>All our meters going forward will be smart meters. We plan to replace all our existing meters with smart meters by 2030.</p> <p>Despite having one of the lowest PCC in the country, we have an ambitious demand management programme. We are aiming to reduce PCC to 110l/h/d under dry year conditions by 2045. This is 5 years ahead of the 2050 target date set by the Government. By 2050, our PCC will be lower than 110l/h/d. We will continuously monitor the effectiveness of our demand management initiatives and closely follow developments in this area across the UK water sector. If needed, we will modify our approach and adopt new technology to achieve greater demand savings and/or to achieve them earlier.</p> <p>We provide non-potable supplies to some large industrial users. However, it is not feasible for us to provide dual supplies, potable and non-potable, to each of our customers. This will also require the entire housing stock across our supply area to undergo modifications in internal</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|           | <p>sense and could also reduce pressure on the sewers which result in the current bad practice of releasing sewage into the sea during heavy rains.</p> <p>-Non-sustainable resources (fourth) - the initial stages outlined above may help to reduce both local abstraction which negatively affects ecosystems; and reliance on Norway tankered water - in my view completely unsustainable - as shipping will have to reduce substantially to meet net zero requirements unless it is decarbonised rapidly.</p> <p>-Conventional improvements to business as usual (after all other avenues have been enacted) - for instance, technological adaptations - this is where effluent recycling could play a role, I would urge the precautionary principle and pilot this on a small-scale for non-potable use.</p> <p>Please undertake more robust collaboration and foresight around the interdependencies of truly sustainable water provision, some unsustainable issues which require your review include:</p> <p>Carbon emissions from the proposal - not currently enabling net zero</p> <p>Environmental impact - I couldn't find details, there is huge negative environmental impact yet this doesn't seem to be recognised and these can be avoided with the approaches outlined above</p> <p>Ecological impact - these seem to be unacceptably high, harming the local ecology which is in rapid decline, I could not find the detailed studies you refer to and it is hard to navigate the resources you have made available</p> <p>Population predictions - unclear and need to be locally based, and cross-referenced with other factors eg: we have an aging population in some areas, lots of development on flood plains, plenty of second or third home ownership etc</p> <p>Climate change impacts - extreme precipitation events and the need to respond to these is not included that I could see and we must keep our sea and remaining waterways clean</p> <p>Planning and land use changes - lack of sustainable urban drainage in current and planned infrastructure developments</p> <p>Hampshire Grid and Hampshire zones - recent funded changes/improvements</p> <p>Over all, there was so much information, even with a PhD and working in sustainability I felt put off from responding as I feel like there is a lack of transparency and a focus on profit and business as usual.</p> <p>I look forward to hearing from you and hope you will pause and start from a different point to ensure truly sustainable actions for collective good.</p> | <p>plumbing. We do not consider this to be a realistic option. We are working with developers to recycle as much water as possible on new developments at the site level.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>Regarding storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. At local scale, we have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>Regarding the viability of sea tankering, this option is no longer included in our plan.</p> <p>We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050.</p> <p>The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <p>We have engaged an independent consultant for our environmental assessments who are following the standard methodology for these assessments. The investment model takes into account the outcome of environmental assessments and if two otherwise equivalent options are available, it will select the option with lower environmental impact.</p> <p>As the environmental regulators of the water industry, the Environment Agency and Natural England have provided detailed comments regarding the HRA, alongside our other environmental assessments, for the WRMP. Work is being undertaken by our consultants</p> |

|           |          | <p>WSP to address these comments and make any necessary changes to the HRA so that it incorporates and reflects regulatory comments.</p> <p>We have a dedicated team who scope and deliver natural solutions to reduce the water quality risks to our drinking water supplies, and deliver ecological resilience schemes as part of a suite of mitigation measures, including abstraction licence reductions, to address identified impacts from our abstractions. In AMP8 we are investing £90m on natural solutions, including habitat and biodiversity improvements, reduced risk of spread of invasive non-native species, in river enhancements, catchment management with the agricultural sector and Catchment Partnerships, chalk stream enhancement and SSSI management. This is a long term programme that started in AMP6, and natural solutions are embedded in our long term delivery plans.</p> <p>For dWRMP24 we, together with the other WRSE companies, commissioned Edge Analytics to provide growth forecasts for all companies, in line with government guidelines. Edge Analytics used the latest available local plan data, as well as data from the Office for National Statistics (ONS) and the Greater London Authority (GLA), to produce projections at a WRZ level. Separate forecasts were developed for total population, household population, non-household population, dwellings, dwellings occupancy, population in commercial properties and business counts. Following the publication of latest WRPG in March 2023, we commissioned an update to that forecast (along with other WRSE companies), which enabled us to consider growth under five different projections based on data from Local Authorities, ONS and OxCam. We have not based our plan on a single population forecast but have used a range of population forecasts to determine the nine future supply-demand balance scenarios that we have planned for (see Section 5.5.3 of the rdWRMP24 Technical Report). The estimates of future population growth range is from 7% to 34% growth at the company level between 2025 and 2075. The range of growth forecasts considered each of our WRZs is shown in Section 2 of Annex 7 that accompanied rdWRMP24 Technical Report. As part of our adaptive planning approach, we will track population growth and switch to the most appropriate supply-demand balance situation.</p> <p>All water companies in England and Wales are required to plan for a drought of a 1-in-500 year severity.</p> <p>We have fully accounted for the availability of the Hampshire Grid and the flexibility it offers in moving water around Hampshire. However, the grid will deliver its optimum benefit where there is sufficient water available in Hampshire to transfer across the area. This will require the completion of the Havant Thicket Reservoir and the HWTWRP.</p> <p>Regarding transparency, our Statement of Exclusion published on our consultation web page (see below) detailed those documents that were not published online due to material being commercially sensitive, or restricted under section 37(B) of the Water Industry Act 1991, or 'the Act' (as amended by the Water Act 2003). We are required to make sure that all published documents comply with the Security and Emergency Measures Direction (SEMD).</p> |

For the fdWRMP24 we are making as many of the documents available on our website as possible although some information has been redacted so as to comply with SEMD and, in line with guidance, we do not publish any material of a commercially confidential nature.</p> <p>The information provided in many of the documents is very technical with many requirements set out in statutory process and supporting guidance. As this is unavoidable we produced a non-technical summary document for those seeking a high level understanding of our plan. You can view the publicly available documents on the link below.<br/> <a href="https://waterresources.southernwater.co.uk/find-out-more/">https://waterresources.southernwater.co.uk/find-out-more/</a></p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p>                                                                                                                                                                           |
| WRMP1011  | <p>I am a Havant borough resident and wish to raise concerns regarding Southern Water's application to recycle effluent at the Havant Reservoir site.</p> <p>Firstly I would like to say that the water companies involved in the reservoir development have been less than open and honest with residents regarding the development, which involved destruction of ancient woodland, loss of habitat for rare species and loss of access to the countryside for residents from some of the poorest wards in the country. Residents were assured that the reservoir would be filled with spring water and rain water, and they withheld plans for a effluent treatment centre from their original application.</p> <p>Southern Water has an appalling track record of pollution and regularly releases sewage in coastal areas without earning the public. I do not have confidence in their ability to recycle water safely. We do not have a water shortage in our area, and are not predicted to have one; surplus water from our springs goes out to sea every year, and there are huge issues with water being wasted from leaking and burst pipes.</p> <p>The environmental impact of the effluent recycling scheme is a huge concern with reject water from the plant being discharged at a high concentration level into the Solent. Southern Water have confirmed themselves that this will have a significant effect.</p> <p>The cost to Southern Water's customers will be considerable; the site is more than 40km from where the water is needed, and the cost of treating and transporting the water will be huge.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years, but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling and desalination. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society.</p> <p>With regard to planning for Havant Thicket, Southern Water's Gate 1 and Gate 2 submissions to its regulators in both 2020 and 2021 confirmed investigation of alternative options for both water recycling and water transfers involving Havant Thicket Reservoir.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead</p> |

|           | I believe that this development will, if allowed to go ahead, cause further damage to the environment, be at a huge cost to the customer, and be energy inefficient. I request that DEFRA refused consent for this application. | <p>after listening to our <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">customers</a>: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>With regards to your concern about leakage: The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>Water recycling is widely used around the world to create a new source of supply that means less water needs to be taken from the environment supporting wildlife, particularly in a drought. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were. With regards to your concern about the Solent, a further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Regarding your comment about energy efficiency: Through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact. As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible. We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our <a href="#">Net Zero Plan</a> will be key to mitigating the greenhouse gas emissions associated with the options</p> |
| WRMP1012  | I live on Hayling Island in Hampshire and wish to object to the revised Water Resources Management Plan that I understand has been submitted by Southern Water. There are a large number of issues, but the worst (IMHO) are:   | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Reference | Feedback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|           | <p>- lack of a plan to adequately address the current wastage of water through leakage</p> <p>SW lose 100 million litres of water every day to leaks, that is 19% of all the water they abstract from the environment, which customers pay to treat, wasted through leakage in their distribution system. Yet their slow programme for improvements means even by 2050 they will still be leaking about 10% of all the water they treat, including the new water manufactured at huge cost from their planned new effluent recycling schemes.</p> <p>- high climate impact</p> <p>The selection of effluent recycling via Havant Thicket and transfer (40km) to [REDACTED] results in unacceptably high carbon impact and greenhouse gas emissions, more than double that of any other transfer or desalination scheme. Apparently restricted documents confirmed that the Hampshire effluent recycling/ transfer scheme has a higher total carbon, average carbon emissions &amp; embedded carbon impact than sea tankering water in from Norway! [which is also a ridiculous proposition for a country with such high rainfall as England does].</p> <p>- inadequate plans to harvest more rain</p> <p>The plan does not strive to work with predicted changes to our climate to capture more winter rain for use in dry summers. Rainwater provides a good quality free raw water resource and we need to prioritise schemes that capture and store it for dry summers.</p> <p>Please do not allow this Plan to be accepted. Any new plan should at least address the 3 points above.</p> | <p>programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>Multiple options were considered during the options appraisal process that was carried out as part of the RAPID gated process to identify alternatives to West Southampton Coast desalination and the HWTWRP consistently scored higher than other options. It was approved by RAPID for adoption as the preferred Strategic Resource Option (SRO) to be progressed in Hampshire. Please see section 3.2 in our fdWRMP24 for more detailed reasoning on why West Southampton Coast desalination was not taken forward beyond RAPID Gate 2.</p> <p>Using Havant Thicket reservoir to store purified recycled water has been selected as the optimum way of making up a large part of the shortfall we face in Hampshire. Pumping 60 million litres of water a day into the reservoir will allow up to 90 million litres a day to be taken during a drought.</p> <p>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</p> <p>As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible.</p> <p>We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <p>Sea tankering from Norway is no longer included in our plan.</p> <p>Regarding storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket</p> |

| Reference | Feedback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. At local scale, we have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>We have to meet very challenging demand management and Environmental Destination targets set by the Government. The resulting scale of supply-demand balance deficits requires us to be ambitious as well as innovative to meet future challenges. Environmental sustainability is a key criterion for including options in our plan, regardless of the size of the option.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WRMP1013  | <p>Fundamentally Southern Water's plan must be rejected. On so many counts it is wholly unacceptable.</p> <p>I share with you a number of reasons for rejecting this plan. To be frank there are many reasons and I know you will receive many letters and emails exposing Southern Water's plan as being wholly unacceptable.</p> <p>1 -Southern Water's plan commits us to paying for recycled effluent as the primary source of our drinking water every day of the year, year on year. Aside of the many reasons I shall draw to your attention later we shall all be committed to paying vast sums for a service that extracts water from effluent which includes raw sewage and water run-off into the recycling plant. There is no alternative or second option on offer.</p> <p>2-There is no plan to abstract water from lower down the catchment area, there is no plan to capture fresh rainwater. Climate change predictions show that we are likely to encounter wetter winters. Quantity of rainfall predictions indicates sufficient rainfall to supply all our water needs if it were collected. No such plan exists to create more reservoir catchments.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback. We respond to your points below.</p> <p>1) We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding sustainable water supplies into the future means we need to look at all viable alternatives to the sources that have been traditionally used. The Hampshire Water Transfer and Water Recycling Project (HWTWRP) is being funded in the same way as any funding for new infrastructure and improvements on the water supply side of the business, which is averaged across water supply customers' bills across our region. As with all costs and charges to customers, funding for HWTWRP will be subject to approval by our economic regulator, Ofwat. We anticipate that Ofwat would spread the cost of construction and operation over the life of the Project once built, to reduce the impact on bills in any one year. HWTWRP is continuing to be developed and we currently estimate that the cost to each of our water supply customers would be approximately £2.50 a month over a 20-year period.</p> <p>2) We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable as a result of the reduction in abstraction licences on the whole river and groundwater system and potential impact on migratory fish. New reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. It should be noted however that these will be in addition to, rather than instead of, the HWTWRP with a greater need for new water resources driven by the requirement to reduce abstraction from rivers and groundwater as part of the government's 25-year Environment Improvement Plan. A Chalk Managed Aquifer Recharge (MAR) feasibility trial is also being considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|           | <p>3 – The Candover Drought Option should not be permitted to continue beyond 2030. The [REDACTED] river abstraction should be moved to nearer the tidal zone. Climate predictions indicate drier summers. Our rivers need a flow to sustain biodiversity and protect wildlife.</p> <p>4 – it is incredulous that Southern Water would tanker in water from Norway should we have a drought. This shows a complete disregard, or perhaps deliberate intent, not to make use of our own rainfall. Water inevitably contains organisms. Mixing water from one country with our own, opens up the possibility of bringing in unwanted 'guests' which could devastate our own wildlife. Further altering the pH of our water could have deleterious effects on our own wildlife.</p> <p>5 – Southern Water manipulate population figures and thus inflate water demand needs so they can dismiss using alternative schemes to provide fresh water for our needs on the grounds that these alternatives would be insufficient to meet demand. This way they wholly dismiss all plans to build more reservoirs to capture the plentiful supply of rainwater. They dismiss improvements to abstract river water from nearer the tidal zone when in wintertime there is plenty of water in the rivers and when abstraction would not threaten wildlife. They make a token gesture to improving infrastructure to markedly reduce water leaks. That they dismiss all these options leads one to consider that their plan is primarily a means to 'feather their own nest' from a financial point of view. Their plans are so energy intensive and, as previously stated, commit them to using the high energy method 365 days of every year and we shall pay the price.</p> <p>5 – It is of considerable concern that Southern Water would appear to be manipulating the Investment Model to prevent the selection of smaller more sustainable schemes until after 2030, in favour of continued use of drought permits on the Test and Itchen, and the selection of larger schemes which cannot be delivered until later, to make sure the Company get the solution they want selected, which delivers more guaranteed profits.</p> <p>6 – The scheme is incredibly energy intense. To pump treated effluent up to Havant Thicket Reservoir and then transfer the water over to [REDACTED] some 40+ kilometres away will require considerable energy. As such this method has a very high carbon impact and will result in release of considerable greenhouse gases. This process will occur every day of the year, year on year, regardless of the rain that falls during the winter, regardless of the huge volume of water that flows from our rivers to the sea.</p> <p>7 – Southern Water say they are committed to net zero by 2030 yet their scheme is probably one of the most energy demanding schemes that could be devised.</p> | <p>3) It is our desire to avoid the use of drought options and become more drought resilient. We are working on this and we are making significant investments to reduce our need for the Candover/Test/ Itchen drought permits and orders. However, at the moment, as we wait for the delivery of HWTWRP, the reliance on some drought options (e.g. the River Test Drought Permit) is essential because, without it, there would be insufficient supply to meet the demands of thousands of our customers in Hampshire. We discuss the changed delivery dates in Section 6.3.4 of our rdWRMP24 Technical Report.</p> <p>4) Regarding the temporary option to ship in water from Norway (between 2031-2034), this option is no longer included in our plan.</p> <p>5a) For dWRMP24 we, together with the other WRSE companies, commissioned Edge Analytics to provide growth forecasts for all companies, in line with government guidelines. Edge Analytics used the latest available local plan data, as well as data from the Office for National Statistics (ONS) and the Greater London Authority (GLA), to produce projections at a WRZ level. Separate forecasts were developed for total population, household population, non-household population, dwellings, dwellings occupancy, population in commercial properties and business counts. Following the publication of latest WRPG in March 2023, we commissioned an update to that forecast (along with other WRSE companies), which enabled us to consider growth under five different projections based on data from Local Authorities, ONS and OxCam. We have not based our plan on a single population forecast but have used a range of population forecasts to determine the nine future supply-demand balance scenarios that we have planned for (see Section 5.5.3 of the rdWRMP24 Technical Report). The estimates of future population growth range from 7% to 34% growth at the company level between 2025 and 2075. The range of growth forecasts considered each of our WRZs is shown in Section 2 of Annex 7 that accompanied rdWRMP24 Technical Report. As part of our adaptive planning approach, we will track population growth and switch to the most appropriate supply-demand balance situation.</p> <p>5b) The investment model needs to objectively select options based on standardised input criteria. It cannot be configured to preferentially select either smaller or larger options as that will lead to biased results and it cannot be demonstrated that the preferred plan is either least cost or best value. It does select drought options in preference to large infrastructure schemes and that is because drought options typically do not have large CAPEX expenditure. This is explained in further detail in Annex 20 of our rdWRMP24 (section 6). The National Framework, Water Resource Planning Guideline and other supplemental policies all recognise the need for water resource plans to not only secure a water supply but to also add to wider environmental and societal benefit.</p> <p>6) Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result,</p> |

|           | <p>8 – That Southern Water's plans to reduce water leakage are so poor is of grave concern. We pay for that lost water and they profit from that lost water! Their timescale to make improvements is wholly inadequate. Far too much water is leaked.</p> <p>9 - It goes beyond crass stupidity that Southern Water plan to build on the old landfill site on Broadmarsh. Given their atrocious record of water leaks and deliberate sewage releases I have absolutely no faith that they can build on the landfill site without there being a calamity, if not a catastrophe. The potential for leakage of obnoxious substances is just too high a price to pay.</p> <p>Anyone of the above points I draw to your attention should be sufficient to turn down Southern Water's plan. Collectively these points, and you will receive many others, conclusively shows that Southern Water's plan is absolutely and wholly unacceptable. It is a plan that ensures a high cash flow, daily return for Southern Water's stakeholders at our expense. Further, should it be accepted by yourselves, it sets a very dangerous precedent for future schemes. You have amongst other sound reasons for refusal such as scientific and financial, a moral obligation to refuse this plan.</p> | <p>in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</p> <p>7) As WRMP24 options are constructed, our baseline emissions will evolve. This will increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible. We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <p>8) The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>9) Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response.</p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| WRMP1014  | <p>The referenced Management Plan is, I understand, now with DEFRA for approval/rejection due to its strategic implications. As part of the consultation process concerning Southern Water's proposal, I wish to object to this plan. I enclose a short summary of the reasons behind my objections and respectfully request you consider them when making your decision.</p> <p>I am a registered voter in the East Hants constituency and as a customer of both Southern Water and Portsmouth Water I am impacted by the consequences of this proposal.</p> <p>The enclosure replaces the one dated 3rd December which I mistakenly emailed yesterday, for which, once again, I apologise.</p> <p>I am writing to object to the draft plan referenced above. I am a registered voter in the East Hants constituency and have been a customer of both Southern Water and Portsmouth Water for many decades and therefore qualified to comment.</p> <p>For any plan or project to be approved, three criteria must be satisfied. First, the technical solution should be the optimum method of solving the problem for which it is designed - no more, no less - with minimum risk to the expected benefits. Second, the company implementing it should have form in delivering relevant projects in size and complexity, to time, budget and quality. Third, it should be the best risk-considered investment choice. On all three grounds this plan fails.</p> <p><b>TECHNICAL SOLUTION</b></p> <p>The proposed technical solution posits the addition of recycled waste water to fresh water in Havant Thicket Reservoir. The consequences of unforeseen cross-contamination of drinking water are not trivial given the huge populations potentially affected.</p> <p>The water is then transferred through high value, hard access locations to where it is needed. This seems unnecessarily high risk, requiring additional investment and a perpetual drain on in-year costs. This solution also requires advanced techniques (for the UK in this context) for recycling effluent and therefore constitutes a high risk of financial overrun and technical failure. The recycling of effluent will take place on landfill. Given that the construction work will intrude into a contaminated landfill site there is a high risk of environmental degradation of the nearby coast.</p> <p>This high emission, high carbon footprint solution seems to be oblivious of the UK's responsibility to reduce the effects of climate change and might cause the company to abandon its commitment to carbon neutrality by 2030. Other, more sustainable solutions which fit better with the constraints of climate change are, I'm sure, available and should be seriously considered. Indeed, the 100m litres of water extracted daily but never used due to leakage might be a place to start.</p> <p><b>THE COMPANY</b></p> <p>I can't see why Southern Water, given its poor record of failures and prosecutions for breaches of the rules governing water treatment, might behave differently with a critical project like this. Moreover, the regulatory framework for this industry appears to be so unfit for purpose that holding such a company to meaningful account seems unlikely. This therefore poses yet another risk to delivery of the expected benefits.</p> <p>Given the funding and ownership business model for UK water, the</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We note your concerns regarding the use of recycled water in Havant Thicket. Following reductions in the amount of water we can take from Rivers Test and Itchen and their associated aquifers, we need to find at least 166 million litres of water a day and with further restrictions on the amount of water we can take from the environment expected in the future, that number may rise. The Hampshire Water Transfer and Water Recycling Project (HWTWRP) is needed to help protect the Test and Itchen by reducing abstractions and providing a new water source for the county.</p> <p>Water recycling creates a safe and sustainable supply of purified recycled water that, after being pumped into Havant Thicket Reservoir and taken again for further treatment to strict UK drinking water standards, would be sent into supply. Water recycling is already widely used around the world – in Australia, Singapore, the USA and Belgium. Southern Water is one of several water companies in the UK developing water recycling plants to create new sources supply for the future. Water recycling plants use advanced treatment techniques to turn treated wastewater into purified, recycled water that can be used as a source of water for drinking water supplies. The treatment process includes using special membranes in a process called reverse osmosis (where the membranes' perforations are more than 50,000 times smaller than the width of a human hair) and using ultraviolet light and hydrogen peroxide in a process called advanced oxidation. A Water Recycling Pilot Plant was set up at Portsmouth Harbour WTW Wastewater Treatment Works to test key elements of the water recycling treatment process. Initial results indicate that the water recycling technology effectively managed numerous different nutrients and metals. The plant will monitor the quality of the treated effluent from Portsmouth Harbour WTW and will shut down if this moves outside of the treatable parameters. A detailed report will be published later in the year, with the results informing additional assessments including the Environmental Impact Assessment for the Project. For more information about water recycling please visit: <a href="http://www.southernwater.co.uk/water-recycling">www.southernwater.co.uk/water-recycling</a></p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each</p> |

|           | <p>susceptibility of critical water industry companies to predatory behaviour through acquisition, (cf. Macquarie/Thames Water) appears also to present a risk.</p> <p>RISK CONSIDERED INVESTMENT CHOICE.</p> <p>In the end the consequences of the high risks (both low and high probability) will all be financial. Risks can either be avoided or hedged with contingency funding. In the case of this plan the huge financial commitment required to underwrite such an endeavour sits poorly with the economic state of the UK right now.</p> <p>Given the risks, the novelty and the potential costs I believe this is not a measured and responsible investment for UK citizens. It seems to have all the hallmarks of a last-minute opportunistic piggyback on the excellent work that Portsmouth Water have had in train for many years.</p> <p>CONCLUSION</p> <p>Since DEFRA is charged with responsible decision making in UK citizens' interests, it should reject this plan and require Southern Water to resubmit proposals with a lower and more balanced risk profile, better sustainability and better value for money.</p> <p>The assessment of this project will be a serious test for the leadership qualities of our parliamentarians, DEFRA and the regulator. They, I understand, have the power to prevent its further progress and have, I believe, been provided with the arguments to support such a move.</p> | <p>successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</p> <p>As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible.</p> <p>We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <p>We have taken significant steps over the last 5 years to address past performance - please see <a href="#">Our Business Turnaround Plan   Southern Water</a> for details.</p> |
| WRMP1015  | <p>I have just found out that today is the last day of a public consultation I did not know about.</p> <p>My gut instinct screams out against my drinking water coming not from the purest source but going through a risk-fraught process of effluent cleansing. I'm sure it will all be fine, until something goes terribly wrong.</p> <p>At this time when as a society we have to stand back and take stock of how we live on this planet and how we leave it for the future generation, surely the BLINDINGLY OBVIOUS TRUTH is that we have rainwater galore arriving sporadically and increasingly so. Surely we need to invest to harness this fantastic resource in ways that accommodate the erratic nature of its arriving.</p> <p>RATHER than anally recycling effluent.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We note your concerns regarding the use of recycled water in Havant Thicket. Following reductions in the amount of water we can take from Rivers Test and Itchen and their associated aquifers, we need to find at least 166 million litres of water a day and with further restrictions on the amount of water we can take from the environment expected in the future, that number may rise. The Hampshire Water Transfer and Water Recycling Project (HWTWRP) is needed to help protect the Test and Itchen by reducing abstractions and providing a new water source for the county.</p> <p>Water recycling creates a safe and sustainable supply of purified recycled water that, after being pumped into Havant Thicket Reservoir and taken again for further treatment to strict UK drinking water standards, would be sent into supply. Water recycling is already widely used around the world – in Australia, Singapore, the USA and Belgium. Southern Water is one of</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|           | <p>I have no faith in a company which pours untreated effluent into the seas, to provide safe drinking water.<br/>There are I'm afraid, bound to be horrible mistakes.</p> <p>I am anxious about the intelligence and morality of this plan and the company and others with blinkered similar money making primary goal setting.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>several water companies in the UK developing water recycling plants to create new sources supply for the future. Water recycling plants use advanced treatment techniques to turn treated wastewater into purified, recycled water that can be used as a source of water for drinking water supplies. The treatment process includes using special membranes in a process called reverse osmosis (where the membranes' perforations are more than 50,000 times smaller than the width of a human hair) and using ultraviolet light and hydrogen peroxide in a process called advanced oxidation. A Water Recycling Pilot Plant was set up at Portsmouth Harbour WTW to test key elements of the water recycling treatment process. Initial results indicate that the water recycling technology effectively managed numerous different nutrients and metals. The plant will monitor the quality of the treated effluent from Portsmouth Harbour WTW and will shut down if this moves outside of the treatable parameters. A detailed report will be published later in the year, with the results informing additional assessments including the Environmental Impact Assessment for the Project. For more information about water recycling please visit: <a href="http://www.southernwater.co.uk/water-recycling">www.southernwater.co.uk/water-recycling</a></p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers. <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> |
| WRMP1016  | <p>In response to the Consultation on the Southern Water revised draft Water Resources Management Plan (WRMP) 2024, I am writing to object strongly to this revised WRMP for the following reasons:</p> <p>As a Southern Water and Portsmouth Water customer I am very concerned about the significant costs to consumers over many years, of the proposed Water Treatment &amp; Water Recycling (WT&amp;WR) scheme in the WRMP, when other more environmentally-friendly schemes could provide increased capacity in the water supply at less cost. The proposed WT&amp;WR scheme would incur significant permanent running and maintenance costs in addition to the very high initial capital outlay, which would eventually fall to customers to meet. Alternative more cost-effective schemes could be implemented to provide increased supply capacity to meet demand, and should be pursued instead.</p> <p>The WT&amp;WR scheme would have a serious impact on the environment, resulting in high greenhouse gas emissions. With an abundance of rainfall, particularly during winter, and with greater rainfall predicted for the future due to climate change, it should not be necessary to rely on a very costly scheme using recycled effluent being fed into and stored in the new Havant Thicket Reservoir now under construction. When such high amounts of rainfall are freely available, use of water storage/extraction solutions with less environmental impact and at lower cost are feasible, such as the use of aquifers for additional storage, and increasing current borehole extraction capacity. These and other potential solutions should be pursued instead.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We carry out an options appraisal exercise when we update our plan every 5 years. This exercise is usually carried out by an external consultant and looks at new options as well as options that were previously considered but were not taken forward for a variety of reasons. Cost is one of the factors considered in the options appraisal process but is not the only determining factor. We also need to look at factors such as volume of water that an option can provide, its resilience to climate change, environmental impact etc. in addition to capital and operating costs. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>Regarding the quantification of cost, we calculate capital, operational and carbon costs for each option. These are presented in the Water Resources Planning tables that accompany our plan and are scrutinised by Ofwat as part of our Business Plan. Our capital programmes are delivered in line with our regulatory commitments and operational needs.</p> <p>Reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. It should be noted</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|           | <p>Priority should be given to providing further water storage capacity, and if water extraction is still necessary from rivers, protection of the highly-valued and environmentally important Hampshire chalk streams could be achieved by implementing schemes to limit any water extraction to points much lower downstream, near the tidal limits.</p> <p>Higher priority and more resources should be directed by Southern Water and Portsmouth Water to improving supply infrastructure to reduce significantly the currently very high water supply system leakage rates, in a much shorter timescale.</p> <p>With abundant rainfall available for collection and storage in this country, it should not be necessary to bring in water supplies by tanker from Norway in times of drought, as proposed in Southern Water's revised draft WRMP. Our country would be more self-sufficient with the implementation of alternative water storage/extraction schemes other than importing water from Norway.</p> <p>For the above reasons, I urge the Secretary of State to reject the Southern Water revised draft Water Resources Management Plan (WRMP) 2024. Southern Water should be called on to assess and propose alternative water storage and supply schemes that would be more environmentally-friendly and less costly to customers than the proposed Water Treatment &amp; Water Recycling Project.</p> | <p>however that these will be in addition to, rather than instead of, the HWTWRP with a greater need for new water resources driven by the requirement to reduce abstraction from rivers and groundwater as part of the government's 25-year Environment Improvement Plan.</p> <p>A Chalk Managed Aquifer Recharge (MAR) feasibility trial is also being considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>Despite perceptions that the South-East of England receives high volumes of rainfall, it is nonetheless classified as an area of 'serious water stress' (see <a href="#">Water stressed areas final classification 2021.odt</a>). Water stress is defined as areas where household demand is a high proportion of effective rainfall that is available to meet that demand. It applies to both public water supplies and the natural environment, and takes account of climate change, growth and the need for greater drought resilience of public water supplies. These supplies are also under pressure from reductions in abstraction to make them more environmentally sustainable. The Hampshire Water Transfer and Water Recycling Project (HWTWRP) will address these demands by purifying and re-using water that has already been used for public supply, rather than taking more water from the environment during times of low flows.</p> <p>The temporary option to ship in water from Norway (between 2031-2034), is no longer included in our plan.</p> <p>There will be further opportunity to comment on the HWTWRP during its next consultation and you can register to be kept up to date here; <a href="#">Register - Hampshire Water Transfer and Water Recycling Project</a>.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| WRMP1017  | <p>I am writing to make my representations on the above Plan on which comments have been invited. I write my comments having considerable experience in water resource planning, having been the Engineering Director at Portsmouth Water between 1997 and 2012. I During that time I was responsible for, as well as being heavily involved in the preparation of several of the Company's Water Resources Plans. Those plans together with the foresight of my predecessors have formed the foundation upon which the Company is now developing Havant Thicket which will support the necessary reductions in groundwater abstraction in various catchments.</p> <p>My principal concerns with regard to Southern Water's revised plan are as follows:-</p> <p>The Plan appears to be dependent upon the recycling of treated waste water which, due to it's high energy requirements, will not be sustainable for the environment nor the public purse too. SWS should be developing solutions which are much more sustainable. Whilst it is laudable that the Company should be reducing it's abstractions from important rivers in Hampshire, there is no reason whatsoever why such abstractions cannot be re-sited to enable the current water treatment works to be retained. In addition there is and will continue to be a massive quantity of high quality water being discharged to estuaries during the winter periods which should be stored elsewhere for summer use. My colleagues and I urged them many times during discussions at WRSE twenty years ago, to consider such proposals but they never appeared to be taken seriously</p> <p>SWS leakage rates equate in total to a loss of more than 100Ml/d and this needs to be reduced by a significant increase in their mains renewal programme. Their current rate of mains renewal equates to a replacement rate of 1 in 1000 years which is totally inadequate when the design life of most water mains is 120 years.</p> <p>SWS has a poor record of maintaining it's wastewater network and treatment systems which cannot be relied upon to discharge into Havant Thicket Reservoir, Langstone Harbour and the Solent. I do not believe that they can be relied upon to provide water of sufficient quality to discharge to the reservoir which will normally be receiving spring water from Havant and Bedhampton. There will be far too many risks to deteriorating water quality in the reservoir if this proposal is adopted.</p> <p>SWS needs to do much more to reduce it's environmental credentials by moving abstractions further downstream where they cause less environmental impact, developing local storage solutions, either above or below ground, and avoiding long pumped pipelines. They need to develop low environmental impact solutions not effluent recycling and sea tanker solutions which have very high environmental impacts.</p> <p>Having promoted the development of Havant Thicket Reservoir as a long-term solution for meeting the future need of Portsmouth Waters' customers during my time at the Company, I do not believe that the majority of those customers would be willing to support the development of recycling of effluent from [REDACTED] WWTW. They would not wish it to form a principal part of their public water supply and more especially for it to be developed in order to supply the</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback</p> <p>We carry out an options appraisal exercise when we update our plan every 5 years. This exercise is usually carried out by an external consultant and looks at new options as well as options that were previously considered but were not taken forward for a variety of reasons. Cost is one of the factors considered in the options appraisal process but is not the only determining factor. We have also looked at factors such as volume of water that an option can provide, its resilience to climate change, environmental impact etc. in addition to capital and operating costs.</p> <p>The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>Regarding the quantification of cost, we calculate capital, operational and carbon costs for each option. These are presented in the Water Resources Planning tables that accompany our plan and are scrutinised by Ofwat as part of our Business Plan.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">customers: https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>Our capital programmes are delivered in line with our regulatory commitments and operational needs.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>We consider that current water mains have an average asset life of approximately 100 years. If 0.5% of mains are renewed each year this would mean that, on average, a main is expected to last for 200 years. There are different views in the water sector on the appropriate rate of mains renewal and the amount of investment needed on asset health overall. Our economic regulator Ofwat in its December 2024 final determinations published a roadmap for enhancing understanding of asset health in the sector <a href="https://www.ofwat.gov.uk/publication/pr24-final-determinations-roadmap-for-enhancing-asset-health-understanding-in-the-water-sector">https://www.ofwat.gov.uk/publication/pr24-final-determinations-roadmap-for-enhancing-asset-health-understanding-in-the-water-sector</a> It is</p> |

|           | <p>Southampton and southern Hampshire area when a solution could and should be found elsewhere in Hampshire.</p> <p>The schemes proposed will have not only a high environmental cost but also a very high financial cost which will inevitably will land in the laps of customers of both SWS and PWC.</p> <p>Southern Water need to be directed to look again at their Plans and come up with a much more robust and sustainable plan not for the next 20 years but for many more beyond.</p> | <p>too early to say what the outcome of that work will be in relation to future rates of mains renewal.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>Supplementing the reservoir with purified recycled water will create a new sustainable source of supply.</p> <p>Purified recycled water is extremely clean. Water quality in the reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025.</p> <p>A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>We consider all options, regardless of size, as part of our options appraisal process. In a number of cases, we have considered different capacity variants of the same option. For example, in the case of HWTWRP, we considered water recycling plants ranging in size from 15MI/d to 60MI/d. Similarly, the desalination plans we have considered in the Central and Eastern areas vary in size from 10MI/d to 40MI/d. A number of these plant can be built in a modular fashion i.e. a smaller plant can be built initially but expanded later as the need for water increases. The size of the scheme ultimately selected in the plan represents, in our view, the overall best value for the customers and the environment in terms to being able to meet the anticipated demand, resilience to climate change and delivering Environmental Destination.</p> <p>We have to meet very challenging demand management and Environmental Destination targets set by the Government. The resulting scale of supply-demand balance deficits requires us to be ambitious as well as innovative to meet future challenges. Environmental sustainability is a key criterion for including options in our plan, regardless of the size of the option.</p> <p>Reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were</p> <p>The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> <p>Supplementing the reservoir with purified recycled water will create a new sustainable source of supply. Water recycling is widely used around the world to create a new source of supply that means less water needs to be taken from the environment supporting wildlife, particularly in a drought. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Regarding the environmental impacts of sea tankering, this option is no longer included in our plan.</p> <p>As part of our role to protect and enhance the environment, we are committed to reducing carbon. You can find out more about our carbon policy here:<br/> <a href="https://www.southernwater.co.uk/about-us/our-policies-and-standards/carbon/">https://www.southernwater.co.uk/about-us/our-policies-and-standards/carbon/</a>.</p> <p>We aim to deliver net zero carbon by 2050 and we are expanding our carbon accounting processes to measure the impact of our capital delivery programme. We recognise that carbon may be significant from this option however, due to the required transport methods and temporary nature of the option. We will continue to assess the carbon footprint of this option and balance it against the environmental benefit of protecting the River Test in times of drought. Other environmental impacts may accrue from the laying of a non-permanent pipeline between Southampton Docks and Test Surface Water WSW. These impacts will be fully assessed as part of the planning applications needed for this infrastructure.</p> <p>We have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> |
| WRMP1018  | <p>We, the Liberal Democrat Group on Havant Borough Council, oppose Southern Water's plans to recycle sewage into drinking water and call upon Defra to reject Southern Water's Draft WRMP on the following grounds:</p> <p>Water Recycling is very energy hungry when compared to established systems for delivering water supplies such as reservoirs.</p> <p>Southern Water have not fully explored other, cheaper, and more sustainable ways of providing a reliable supply of drinking water to the South of England. They should be focusing on alternatives such as aquifer recharging and river extraction close to the tidal limit.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling. We understand that some customers may not agree with some of the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|           | <p>SW should prioritise reduction of extraction from the chalk streams, rather than continuing to damage our globally important chalk stream environment while they deliver a technologically complex long-term project which the public do not want.</p> <p>Southern Water's customers will pay for this project, which faces significant public opposition, through long-term increases to their water bills.</p> <p>Southern Water have demonstrated many times that they cannot operate their existing infrastructure. The public should not be expected to trust them to produce drinking water using reverse osmosis with its numerous technical challenges.</p> <p>Southern Water plan to build a reverse osmosis plant on a former landfill site within Havant Borough. When we questioned their choice of site they showed no understanding of the challenges of safe construction on landfill. If anything goes wrong during and after construction, they risk damaging the adjacent nature reserve, Farlington Marshes and exacerbating the known risk of leaching into Langstone Harbour.</p> <p>We believe that the funding mechanism for water companies needs to be changed so they are no longer incentivised to deliver infrastructure-heavy projects but instead work with sustainable solutions which help to mitigate climate change and biodiversity reduction.</p> | <p>proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Environmental sustainability is a key criterion in our options appraisal process alongside additional factors such as volume of water, climate change, environmental impact. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>A Chalk MAR scheme (feasibility trial) is included in our plan for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>The Havant Water Recycling Treatment Plant (HWTWRP) scheme is designed to provide water resources during severe and extreme droughts, when natural groundwater and river water has been depleted due to limited rainfall. It will help to protect natural chalk streams by allowing us and Portsmouth Water to reduce our abstraction impacts on these unique habitats across East Hampshire and West Sussex.</p> <p>The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water.</p> <p>SW has purchased “Site 72”, an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p> |
| WRMP1019  | <p>We, the Liberal Democrat Group on Havant Borough Council, oppose Southern Water's plans to recycle sewage into drinking water and call upon Defra to reject Southern Water's Draft WRMP on the following grounds:</p> <p>Water Recycling is very energy hungry when compared to established systems for delivering water supplies such as reservoirs.</p> <p>Southern Water have not fully explored other, cheaper, and more sustainable ways of providing a reliable supply of drinking water to the South of England. They should be focusing on alternatives such as aquifer recharging and river extraction close to the tidal limit.</p> <p>SW should prioritise reduction of extraction from the chalk streams, rather than continuing to damage our globally important chalk stream environment while they deliver a technologically complex long-term project which the public do not want.</p> <p>Southern Water's customers will pay for this project, which faces significant public opposition, through long-term increases to their water bills.</p> <p>Southern Water have demonstrated many times that they cannot operate their existing infrastructure. The public should not be expected to trust them to produce drinking water using reverse osmosis with its numerous technical challenges.</p> <p>Southern Water plan to build a reverse osmosis plant on a former landfill site within Havant Borough. When we questioned their choice of site they showed no understanding of the challenges of safe construction on landfill. If anything goes wrong during and after construction, they risk damaging the adjacent nature reserve, Farlington Marshes and exacerbating the known risk of leaching into Langstone Harbour.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Environmental sustainability is a key criterion in our options appraisal process alongside additional factors such as volume of water, climate change, environmental impact. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p>                                                                                              |

|           | We believe that the funding mechanism for water companies needs to be changed so they are no longer incentivised to deliver infrastructure-heavy projects but instead work with sustainable solutions which help to mitigate climate change and biodiversity reduction. | <p>A Chalk MAR scheme (feasibility trial) is included in our plan for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>The Havant Water Recycling Treatment Plant (HWTWRP) scheme is designed to provide water resources during severe and extreme droughts, when natural groundwater and river water has been depleted due to limited rainfall. It will help to protect natural chalk streams by allowing us and Portsmouth Water to reduce our abstraction impacts on these unique habitats across East Hampshire and West Sussex.</p> <p>The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water.</p> <p>SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A consultation on</p> |

This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| WRMP1020  | <p>We, the Liberal Democrat Group on Havant Borough Council, oppose Southern Water's plans to recycle sewage into drinking water and call upon Defra to reject Southern Water's Draft WRMP on the following grounds:</p> <p>Water Recycling is very energy hungry when compared to established systems for delivering water supplies such as reservoirs.</p> <p>Southern Water have not fully explored other, cheaper, and more sustainable ways of providing a reliable supply of drinking water to the South of England. They should be focusing on alternatives such as aquifer recharging and river extraction close to the tidal limit.</p> <p>SW should prioritise reduction of extraction from the chalk streams, rather than continuing to damage our globally important chalk stream environment while they deliver a technologically complex long-term project which the public do not want.</p> <p>Southern Water's customers will pay for this project, which faces significant public opposition, through long-term increases to their water bills.</p> <p>Southern Water have demonstrated many times that they cannot operate their existing infrastructure. The public should not be expected to trust them to produce drinking water using reverse osmosis with its numerous technical challenges.</p> <p>Southern Water plan to build a reverse osmosis plant on a former landfill site within Havant Borough. When we questioned their choice of site they showed no understanding of the challenges of safe construction on landfill. If anything goes wrong during and after construction, they risk damaging the adjacent nature reserve, Farlington Marshes and exacerbating the known risk of leaching into Langstone Harbour.</p> <p>We believe that the funding mechanism for water companies needs to be changed so they are no longer incentivised to deliver infrastructure-heavy projects but instead work with sustainable solutions which help to mitigate climate change and biodiversity reduction.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Environmental sustainability is a key criterion in our options appraisal process alongside additional factors such as volume of water, climate change, environmental impact. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>A Chalk MAR scheme (feasibility trial) is included in our plan for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                              | <p>The Havant Water Recycling Treatment Plant (HWTWRP) scheme is designed to provide water resources during severe and extreme droughts, when natural groundwater and river water has been depleted due to limited rainfall. It will help to protect natural chalk streams by allowing us and Portsmouth Water to reduce our abstraction impacts on these unique habitats across East Hampshire and West Sussex.</p> <p>The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">customers: https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water.</p> <p>SW has purchased “Site 72”, an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p> |
| WRMP1021  | <p>We, the Liberal Democrat Group on Havant Borough Council, oppose Southern Water’s plans to recycle sewage into drinking water and call upon Defra to reject Southern Water’s Draft WRMP on the following grounds:</p> <p>Water Recycling is very energy hungry when compared to established systems for delivering water supplies such as reservoirs.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Reference | Feedback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|           | <p>Southern Water have not fully explored other, cheaper, and more sustainable ways of providing a reliable supply of drinking water to the South of England. They should be focusing on alternatives such as aquifer recharging and river extraction close to the tidal limit.</p> <p>SW should prioritise reduction of extraction from the chalk streams, rather than continuing to damage our globally important chalk stream environment while they deliver a technologically complex long-term project which the public do not want.</p> <p>Southern Water's customers will pay for this project, which faces significant public opposition, through long-term increases to their water bills.</p> <p>Southern Water have demonstrated many times that they cannot operate their existing infrastructure. The public should not be expected to trust them to produce drinking water using reverse osmosis with its numerous technical challenges.</p> <p>Southern Water plan to build a reverse osmosis plant on a former landfill site within Havant Borough. When we questioned their choice of site they showed no understanding of the challenges of safe construction on landfill. If anything goes wrong during and after construction, they risk damaging the adjacent nature reserve, Farlington Marshes and exacerbating the known risk of leaching into Langstone Harbour.</p> <p>We believe that the funding mechanism for water companies needs to be changed so they are no longer incentivised to deliver infrastructure-heavy projects but instead work with sustainable solutions which help to mitigate climate change and biodiversity reduction.</p> | <p>all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Environmental sustainability is a key criterion in our options appraisal process alongside additional factors such as volume of water, climate change, environmental impact. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>A Chalk MAR scheme (feasibility trial) is included in our plan for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>The Havant Water Recycling Treatment Plant (HWTWRP) scheme is designed to provide water resources during severe and extreme droughts, when natural groundwater and river water has been depleted due to limited rainfall. It will help to protect natural chalk streams by allowing us and Portsmouth Water to reduce our abstraction impacts on these unique habitats across East Hampshire and West Sussex.</p> <p>The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water.</p> <p>SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p> |
| WRMP1022  | <p>We, the Liberal Democrat Group on Havant Borough Council, oppose Southern Water's plans to recycle sewage into drinking water and call upon Defra to reject Southern Water's Draft WRMP on the following grounds:</p> <p>Water Recycling is very energy hungry when compared to established systems for delivering water supplies such as reservoirs.</p> <p>Southern Water have not fully explored other, cheaper, and more sustainable ways of providing a reliable supply of drinking water to the South of England. They should be focusing on alternatives such as aquifer recharging and river extraction close to the tidal limit.</p> <p>SW should prioritise reduction of extraction from the chalk streams, rather than continuing to damage our globally important chalk stream environment while they deliver a technologically complex long-term project which the public do not want.</p> <p>Southern Water's customers will pay for this project, which faces significant public opposition, through long-term increases to their water bills.</p> <p>Southern Water have demonstrated many times that they cannot operate their existing infrastructure. The public should not be expected to trust them to produce drinking water using reverse osmosis with its numerous technical challenges.</p> <p>Southern Water plan to build a reverse osmosis plant on a former landfill site within Havant Borough. When we questioned their choice of site they showed no understanding of the challenges of safe construction on landfill. If anything goes wrong during and after construction,</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Environmental sustainability is a key criterion in our options appraisal process alongside additional factors such as volume of water, climate change, environmental impact. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|           | <p>they risk damaging the adjacent nature reserve, Farlington Marshes and exacerbating the known risk of leaching into Langstone Harbour.</p> <p>We believe that the funding mechanism for water companies needs to be changed so they are no longer incentivised to deliver infrastructure-heavy projects but instead work with sustainable solutions which help to mitigate climate change and biodiversity reduction.</p> | <p>thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>A Chalk MAR scheme (feasibility trial) is included in our plan for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>The Havant Water Recycling Treatment Plant (HWTWRP) scheme is designed to provide water resources during severe and extreme droughts, when natural groundwater and river water has been depleted due to limited rainfall. It will help to protect natural chalk streams by allowing us and Portsmouth Water to reduce our abstraction impacts on these unique habitats across East Hampshire and West Sussex.</p> <p>The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water.</p> <p>SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. Building</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| WRMP1023  | <p>We, the Liberal Democrat Group on Havant Borough Council, oppose Southern Water's plans to recycle sewage into drinking water and call upon Defra to reject Southern Water's Draft WRMP on the following grounds:</p> <p>Water Recycling is very energy hungry when compared to established systems for delivering water supplies such as reservoirs.</p> <p>Southern Water have not fully explored other, cheaper, and more sustainable ways of providing a reliable supply of drinking water to the South of England. They should be focusing on alternatives such as aquifer recharging and river extraction close to the tidal limit.</p> <p>SW should prioritise reduction of extraction from the chalk streams, rather than continuing to damage our globally important chalk stream environment while they deliver a technologically complex long-term project which the public do not want.</p> <p>Southern Water's customers will pay for this project, which faces significant public opposition, through long-term increases to their water bills.</p> <p>Southern Water have demonstrated many times that they cannot operate their existing infrastructure. The public should not be expected to trust them to produce drinking water using reverse osmosis with its numerous technical challenges.</p> <p>Southern Water plan to build a reverse osmosis plant on a former landfill site within Havant Borough. When we questioned their choice of site they showed no understanding of the challenges of safe construction on landfill. If anything goes wrong during and after construction, they risk damaging the adjacent nature reserve, Farlington Marshes and exacerbating the known risk of leaching into Langstone Harbour.</p> <p>We believe that the funding mechanism for water companies needs to be changed so they are no longer incentivised to deliver infrastructure-heavy projects but instead work with sustainable solutions which help to mitigate climate change and biodiversity reduction.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Environmental sustainability is a key criterion in our options appraisal process alongside additional factors such as volume of water, climate change, environmental impact. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>A Chalk MAR scheme (feasibility trial) is included in our plan for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of</p> |

|           |          | <p>the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>The Havant Water Recycling Treatment Plant (HWTWRP) scheme is designed to provide water resources during severe and extreme droughts, when natural groundwater and river water has been depleted due to limited rainfall. It will help to protect natural chalk streams by allowing us and Portsmouth Water to reduce our abstraction impacts on these unique habitats across East Hampshire and West Sussex.</p> <p>The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water.</p> <p>SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| WRMP1024  | <p>We, the Liberal Democrat Group on Havant Borough Council, oppose Southern Water's plans to recycle sewage into drinking water and call upon Defra to reject Southern Water's Draft WRMP on the following grounds:</p> <p>Water Recycling is very energy hungry when compared to established systems for delivering water supplies such as reservoirs.</p> <p>Southern Water have not fully explored other, cheaper, and more sustainable ways of providing a reliable supply of drinking water to the South of England. They should be focusing on alternatives such as aquifer recharging and river extraction close to the tidal limit.</p> <p>SW should prioritise reduction of extraction from the chalk streams, rather than continuing to damage our globally important chalk stream environment while they deliver a technologically complex long-term project which the public do not want.</p> <p>Southern Water's customers will pay for this project, which faces significant public opposition, through long-term increases to their water bills.</p> <p>Southern Water have demonstrated many times that they cannot operate their existing infrastructure. The public should not be expected to trust them to produce drinking water using reverse osmosis with its numerous technical challenges.</p> <p>Southern Water plan to build a reverse osmosis plant on a former landfill site within Havant Borough. When we questioned their choice of site they showed no understanding of the challenges of safe construction on landfill. If anything goes wrong during and after construction, they risk damaging the adjacent nature reserve, Farlington Marshes and exacerbating the known risk of leaching into Langstone Harbour.</p> <p>We believe that the funding mechanism for water companies needs to be changed so they are no longer incentivised to deliver infrastructure-heavy projects but instead work with sustainable solutions which help to mitigate climate change and biodiversity reduction.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Our Water Resource Management Plan not only has to look at our water needs for the next 5 years but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Environmental sustainability is a key criterion in our options appraisal process alongside additional factors such as volume of water, climate change, environmental impact. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>A Chalk MAR scheme (feasibility trial) is included in our plan for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>The Havant Water Recycling Treatment Plant (HWTWRP) scheme is designed to provide water resources during severe and extreme droughts, when natural groundwater and river water has been depleted due to limited rainfall. It will help to protect natural chalk streams by allowing us and Portsmouth Water to reduce our abstraction impacts on these unique habitats across East Hampshire and West Sussex.</p> <p>The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water.</p> <p>SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p> |
| WRMP1025  | <p>I was a [REDACTED] for many years and represented [REDACTED] from its inception.</p> <p>I am deeply concerned by the way in which the plans have been altered by Southern Water. There needs to be more concentration on sustainable solutions that work with Climate change and put the Environment before profit.</p> <p>I am particularly concerned about the risks in the Havant proposal on the development of a sewage recycling facility on a landfill in Havant. The large internal shafts through 13 ft of landfill waste brings risks to local aquifers and to the Solent.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Environmental sustainability is a key criterion in our options appraisal process which we carry out when we update our plan every 5 years. Capital, operational and carbon cost are some of the factors considered in the options appraisal process but we do consider others. We have also looked at factors such as volume of water that an option can provide, its resilience to climate change, environmental impact etc. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Reference | Feedback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|           | <p>Southern Water needs to concentrate on repairing and controlling leakages and installing solutions, such as underground storage aquifers for winter rainfall. I understand that they are, at present, losing 100 million litres of water a day through leakages.</p> <p>The public is very uneasy regarding recycled drinking water and there is also unease regarding possible contamination of the Havant Reservoir when water from recycling plants is pumped into it.</p> <p>The scheme for importing water by tanker from Norway at huge expense, at times of drought, with the need for the water to be treated because it has a different chemical make-up, would be laughable ,if it was not being seriously considered.</p> <p>There is also a concentration on hugely expensive, and anti environmental, plans, such as the recycling of water from Havant Thicket to [REDACTED], which would have a high carbon impact and green gas emissions..</p> <p>There was never a real reason given for abandonment of the desalination plant near Southampton.</p> <p>There are so many serious implications here that I would ask for permission for the thern Water Plan to be refused and that a better , more environmental and sustainable plan be drawn up as a matter of urgency.</p> | <p>Ofwat regulates the amount of profit that water companies can make which for the next 5 years cannot exceed 4.03%.</p> <p>SW has purchased “Site 72”, an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward. A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>No untreated wastewater will enter Havant Thicket reservoir. The HWTWRP scheme uses global best practice with a multi-barrier approach and monitoring to ensure that the water quality is exceptional when transferred to Havant Thicket reservoir.</p> <p>Water recycling is widely used around the world to create a new source of supply that means less water needs to be taken from the environment supporting wildlife, particularly in a drought.</p> <p>Regarding the viability of sea tankering, this option is no longer included in our plan.</p> <p>We acknowledge that water recycling will use more energy than conventional sources of supply. However, these conventional sources are no longer available to us as they once were due to WINEP investigation driven license changes to achieve sustainable abstraction. As with HWTWRP, this has necessitated investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact. As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain</p> |

We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <p>We submitted our detailed assessment of the desalination option on the Southampton coast to RAPID in 2021. We had recommended removal of the option primarily due to the potential environment impacts. RAPID agreed with our assessment. The assessment of our submission by RAPID is available on Ofwat's website <a href="https://www.ofwat.gov.uk/wp-content/uploads/2022/03/Strategic-regional-water-resource-solutions-accelerated-gate-two-final-decision-for-Desalination.pdf">https://www.ofwat.gov.uk/wp-content/uploads/2022/03/Strategic-regional-water-resource-solutions-accelerated-gate-two-final-decision-for-Desalination.pdf</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WRMP1026  | <p>I have lived in Horndean and Clanfield for almost 50 years, with our family being customers of Portsmouth Water (for water supply) and Southern Water (for sewage disposal). Portsmouth Water has been forward looking in planning a reservoir at Havant Thicket to provide enough water, sustainably sourced, for its future customers. Additionally it will be a wonderful amenity for nature and the local community, which supports it. However, I am strongly opposed to Southern Water's revised draft Water Resources Management Plan, which puts the whole project at risk. Southern Water should not be planning to poach from Portsmouth Water. Instead of endangering the spring fed reservoir with the addition of recycled effluent, Southern Water should be considering far cheaper and more sustainable solutions suggested below in solving the problem of future water shortfall for Southampton and Winchester.</p> <p>Southern Water should reduce leakages. At present more than 100 million litres of water is lost every day with 3% of what Southern Water takes from the environment lost before reaching the treatment works and a further 19% lost in leakage in the distribution network. Therefore a faster programme of renewing water mains to replace the ageing pipe network should be their priority for increasing the amount of water they have to distribute.</p> <p>Southern Water cannot be trusted with new complex technology for advanced effluent recycling (untested in the UK for this purpose). Southern Water has a very poor track record of treatment plant and pumping station failures, with many prosecutions for pollution incidents and failure to take prompt action to solve problems. This would mean a high risk of pollution not only to the reservoir at Havant but also considerable environmental damage to Langstone Harbour, an important nature reserve, and also to the Solent.</p> <p>Southern Water should be considering more sustainable solutions rather than planning a £1.2 billion scheme to recycle treated waste water to store in Havant Thicket Reservoir and then transport much of it many miles to where it's needed. Due to climate change, winter rainfall, is predicted to increase. Therefore instead of recycling waste water, storing water from rainfall in reservoirs and confined aquifers for use at drier times of year would be cheaper and more sustainable. Also more of these schemes would help reduce flooding. At present only 1% of rainfall is collected in the UK, which is extremely wasteful.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Using Havant Thicket reservoir to store purified recycled water has been selected as the optimum way of making up a large part of the shortfall we face in Hampshire. Pumping 60 million litres of water a day into the reservoir will allow up to 90 million litres a day to be taken during a drought. A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations. Should you wish to participate in future consultations on the Hampshire Water Transfer and Water Recycling Project (HWTWRP), please visit our dedicated webpage <a href="#">Hampshire Water Transfer And Recycling Project</a></p> <p>Reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. It should be noted however that these will be in addition to, rather than instead of, the HWTWRP with a greater need for new water resources driven by the requirement to reduce abstraction from rivers and groundwater as part of the government's 25-year Environment Improvement Plan.</p> <p>A Chalk Managed Aquifer Recharge (MAR) feasibility trial is also being considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|           | <p>To fulfil their commitment to be carbon neutral by 2030 Sothern Water should be developing strategies now to protect the environment. River catchments can be better protected if river abstractions are moved closer to the tidal limit, leaving much of a river in a natural state. Storage of water needs to be developed as close as possible to where the water is required so that long, expensive and energy high pipelines, which damage countryside and wildlife are not needed. Southern Water's scheme will cost more than £3 million a year, with pumping and treatment required every day despite the effluent recycling scheme was chosen to be just a drought resource.</p> <p>It is astonishing that during a time of climate emergency that Southern Water has selected schemes with the highest carbon footprint and emissions. The Hampshire and Littlehampton effluent schemes have the highest negative environmental impact score of any of the considered options. The effluent recycling schemes to be developed by 2035 each have a higher carbon impact than the transferring of water from Norway by tanker, which is to be used as an interim solution and indeed that would have an unacceptably high cost and environmental impact.</p> <p>There are major risks from developing an effluent recycling plant on landfill. In particular there is the risk of contamination to the coastal environment. The construction of large tunnel shafts and hundreds of piles through a 13m deep contaminated landfill waste site into the underlying chalk aquifer which is adjacent to Langstone Harbour poses a very high contamination risk.</p> <p>The Hampshire effluent recycling scheme will deliver a profit of about £45 million to Southern Water. This has undoubtedly been a factor in their choice of this scheme. This sort of profiteering paid for by customers is unacceptable as would be the cost of servicing the massive debt created. This shows that Defra needs to change the water industry funding mechanism to stop incentivising expensive infrastructure heavy solutions but encourage the development of more sustainable solutions that work with climate change.</p> <p>There has been inadequate publicity and public consultation about Southern Water's plan. All Southern Water and Portsmouth Water customers should have been informed by letter that there could be a major change to their water supply under this scheme. They were not informed. In our area our Green District Councillor raised awareness but elsewhere little is known about what is planned and therefore they have not had the chance to give Defra their views. Research has shown that customers prefer more natural and sustainable solutions but Southern Water have taken no notice.</p> | <p>this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>We know our past performance was not good enough and as a result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers:<br/> <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>With regard to funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p> <p>Sea tankering from Norway is no longer included in our plan.</p> <p>Our consultation engagement with our customers and stakeholders is described in Annex 5 of our rdWRMP24 Technical Report. In addition to publishing the majority of our rdWRMP24 documents on our website, we arranged 8 roadshows across our supply area during October-November; 3 in our Western area, 2 in our Central area and 3 in our Eastern area. Southern Water staff were available at these roadshows to answer any questions on our rdWRMP24. Hard copies of our rdWRMP24 Technical Report and Non-Technical Summary of our plan were also available for attendees to view and take with them. In addition, we provided 5 area-specific webinars of 75 minutes duration each whereby we presented key features of our plan during the first 35-40 minutes with the remaining time allocated to Q&amp;A. We released a press release regarding the consultation, which was picked up by major newspapers; The Guardian and the Financial Times. We produced both targeted and non-targeted adverts on social media. We also publicised the consultation in our newsletter which, went out to all of our customers. MPs, Stakeholders and previous responders were all directly emailed regarding the consultation. We have received 1,176 responses as part of rdWRMP24 consultation.</p> |
| WRMP1027  | <p>Dear Defra,</p> <p>I read with concern Southern Waters revised WRMP 24 revised plan and unfortunately note that, regarding building an effluent recycling plant at [REDACTED] nothing has changed.</p> <p>I am unable to comment on the proposals that SWA have to supply other areas from sources other than the new Havant Thicket reservoir except to conclude that estimates of the likely demand in 50 years time ,are highly speculative. Plans should be realistic and limited to the Next 10 years.</p> <p>Why does Southern Water want to build [REDACTED] Waste Water Recycling Plant.?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We are planning to build two reservoirs; the Havant Thicket Reservoir with Portsmouth Water and SESRO together with Thames Water and Affinity Water. Our plan also includes provision for building another one in Sussex. We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. We also have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|           | <p>If SWA had sufficient winter storage and managed leakage, consecutive dry winters would not be a problem.</p> <p>The problem that Southern Water has, is the limit of abstractions from the Rivers Itchen and Test. Should for example flow in the Itchen fall below 194M/ltrs/day for EA environmental reasons, abstraction must stop.</p> <p>A possible solution is to capture some , say 50% of this flow just before it gets into the sea and return it back into the Treatment Plants then,River (or aquifer) higher up stream.</p> <p>{A sheet piled curtain wall and a variable height weir may be required to prevent salt water infiltration and of course the necessary pumps and pipeline.}</p> <p>The construction and energy and running costs should be a fraction of those of the [REDACTED] proposal because the distances are so much shorter.</p> <p>Currently Portsmouth Water can supply 15M/ltr/day to Southern Water to the West .and can supply up to a further 75M ltr/day when Havant Thicket Reservoir is completed without the need for costly recycled waste water from [REDACTED]</p> <p>Now let us consider the [REDACTED] proposed recycling plant</p> <p>I was fortunate to attend a recent webinar by Dr Marc Pichou who explained the reverse osmosis process very well.</p> <p>In countries where water is in short supply, recycling can no doubt provide a solution but it is clearly technically very demanding, requires</p> <p>disinfectant(hydrogen peroxide) and other chemicals and lots of energy. In addition he says plants have to operate at least at 30% of capacity 24/7 whether needed or not!</p> <p>The [REDACTED] plant would need to process a minimum flow rate of 30M/ltr/day!!</p> <p>How many successful WWRP are operating in the UK at present?</p> <p>The site proposed is a former tip and is adjacent to the environmentally sensitive Langstone Harbour. Avoiding contamination will prove difficult and expensive.</p> <p>Why are we here?</p> <p>One only has to look at recent rain fall figures to conclude that there are no shortages of water resources on this part of the South Coast.</p> | <p>Regarding moving abstraction points closer to the sea, we have considered such options. One of the complications with moving abstractions close to sea is the impact of tides on the duration of abstraction and water quality. We will be exploring them further for our next plan. A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water. They do inevitably have a higher financial and energy cost than conventional supply sources. These sources are however no longer available to us. Supplementing the reservoir with purified recycled water will create a new sustainable source of supply.</p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>Despite perceptions that the South-East of England receives high volumes of rainfall, it is nonetheless classified as an area of 'serious water stress', see <a href="#">here</a>. We are aiming to reduce PCC to 110l/h/d under dry year conditions by 2045. This is 5 years ahead of the 2050 target date set by the Government. We will continuously monitor the effectiveness of our demand management initiatives and closely follow developments in this area across the UK water sector. If needed, we will modify our approach and adopt new technology to achieve greater demand savings and/or to achieve them earlier.</p> |

|           | <p>The problem is caused by the mismanagement of the existing resources in the area.</p> <p>More winter rainfall needs to be captured and stored in aquifers and reservoirs. Less water needs to be lost or wasted through leakage.</p> <p>Demand needs to be controlled.</p> <p>Expensive clean water must not be allowed to leak out of the pipework.</p> <p>Currently 19% of expensive processed water, leaks from the SWA distribution system!</p> <p>More consideration needs to be applied to PRV pressure control of the distribution network particularly at night.</p> <p>At least 1.0 % of the network needs replacing every year just to achieve the average age of pipework below 100 years!!!</p> <p>I note with interest that SWA blames its recent increase in leakage figures on COVID!!!</p> <p>To cope with future population growth, more rain water needs to be collected locally and used where high quality drinking water is not required.</p> <p>( This will reduce demand but may need to be a planning issue for new developments.)<br/>By way of introduction I am a retired Chartered Civil Engineer and have worked for water companies.</p> <p>I understand the need for investment in the Water Industry( which has given me a good living,) but I fear on this occasion Southern Waters Proposals are more in the interests of its investors, than its customers.</p> <p>What ever plans are finally approved by Defra, Southern Water will inevitably use them to justify very substantial customer price rises, when negotiating with OFWaT</p> <p>Were the price rises awarded in the past used to invest properly in SWA infra structure?<br/>Judging by their recent failures, I think not!!</p> <p>I continue to support the Havant Thicket Reservoir proposal and the supply of surplus Spring water to SWA.</p> <p>We can do without extravagant Waste Water recycling.</p> | <p>For dWRMP24 we, together with the other WRSE companies, commissioned Edge Analytics to provide growth forecasts for all companies, in line with government guidelines. Edge Analytics used the latest available local plan data, as well as data from the Office for National Statistics (ONS) and the Greater London Authority (GLA), to produce projections at a WRZ level. Separate forecasts were developed for total population, household population, non-household population, dwellings, dwellings occupancy, population in commercial properties and business counts. Following the publication of latest WRPG in March 2023, we commissioned an update to that forecast (along with other WRSE companies), which enabled us to consider growth under five different projections based on data from Local Authorities, ONS and OxCam. We have not based our plan on a single population forecast but have used a range of population forecasts to determine the nine future supply-demand balance scenarios that we have planned for (see Section 5.5.3 of the rdWRMP24 Technical Report). The estimates of future population growth range is from 7% to 34% growth at the company level between 2025 and 2075. The range of growth forecasts considered each of our WRZs is shown in Section 2 of Annex 7 that accompanied rdWRMP24 Technical Report. As part of our adaptive planning approach, we will track population growth and switch to the most appropriate supply-demand balance situation.</p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history.</p> |
| WRMP1030  | <p>Please could you raise objections for the Southern Water Proposals.</p> <p>My greatest concern is for the use of recycled sewage effluent to top up our water supply and building a treatment plant in my area.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|           | Fixing the leaks and collecting rainwater would supply us with the water we need. Please intervene with this unacceptable proposal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Your concern about the use of recycled water in Havant Thicket has been noted. Supplementing Havant Thicket reservoir with purified recycled water will create a new sustainable source of supply.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>We have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| WRMP1031  | <p>The original plans for the reservoir said it would be filled by spring water. So why is this changing? If it is a matter of time - many of us have waited years for this reservoir but the majority of us would rather wait longer for it to fill naturally than to have this unpleasant, very extensive and expensive, plan to involve S Water.</p> <p>These proposals would cost £3M a year to treat and pump water to the reservoir. That is crazy and unless all the share-holders of Southern Water say they personally will give up their profits from S Water for at least 10 ears, then this plan should be rejected. Even if they paid- it is an unacceptable plan.</p> <p>I swim in the harbour regularly. More treatment of sewage at [REDACTED] will doubtless increase their discharge of effluent into the harbour. They should solve that problem first as well as the piping costs BEFORE any thought of having any involvemnt with the new reservoir.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>With regard to planning consent for Havant Thicket, Southern Water's Gate 1 and Gate 2 submissions to its regulators in both 2020 and 2021 confirmed investigation of alternative options for both water recycling and water transfers involving Havant Thicket Reservoir. Supplementing Havant Thicket reservoir with purified recycled water will create a new sustainable source of supply.</p> <p>The HTR TCPA is for raw water, but our DCO will change the operational use of the reservoir so that it can store the mix of water that will be used with the HWTWRP. The Rapid G1 and G2 submissions are not related to the planning process.</p> <p>We carry out an options appraisal exercise when we update our plan every 5 years. This exercise is usually carried out by an external consultant and looks at new options as well as options that were previously considered but were not taken forward for a variety of reasons. Cost is one of the factors considered in the options appraisal process but is not the only determining factor. We have also looked at factors such as volume of water that an option can provide, its resilience to climate change, environmental impact etc. in addition to capital and operating costs. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process. Supplementing the reservoir with purified recycled water will create a new sustainable source of supply. We note the objection to the use of recycled water in Havant Thicket. It should be noted that Southern Water has temporarily suspended dividends to shareholders and has not paid dividends since 2017.</p> <p>A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| WRMP1032  | <p>I am responding to Southern Water Services' (SWS) consultation of its Water Resource Management Plan (WRMP).</p> <p>I have found the consultation documents opaque and it is my view that far greater transparency of information is required. It is difficult to understand SWS's reasoning for its long delays in finding alternative supplies of water to stop it abstracting from sensitive chalk streams and aquifers.</p> <p>In particular:</p> <ol style="list-style-type: none"> <li>1. There is a lack of transparency in the consultation as the documents lack high-level figures to explain the way in which predictions on supply, demand and deficit are made.</li> <li>2. There is a lack of real commitment to long-term projects needed to ensure environmental protection from abstraction. For instance, the Water Recycling schemes and the use of the Havant Thicket Reservoir need to be brought forward with tighter time-frames. Southern Water should not be relying on taking water from the rivers and the aquifer.</li> <li>3. There are no long-term "Plan B's" in case the recycling and reservoir options are delayed or abandoned. This means huge risk to important chalk streams and their wild fish populations.</li> <li>4. The plan is not consistent with promises made by the water company to the Environment Agency in 2018 to use "all best endeavours" to bring forward long-term water resource schemes to avoid the use of damaging drought permits and orders.</li> <li>5. The environmental assessments, which describe the impact of the water resource schemes, are full of errors. They do not properly consider the impacts of increased abstraction on the chalk streams and their aquifers.</li> <li>6. The environmental assessments do not deal with the consequences of the Environment Agency's conclusions that there is a salmon "metapopulation" of fish in the southern chalk streams.</li> </ol> <p>It is my view that the plan fails on all fronts: clarity, deliverability, environmental assessment and environmental protection.</p> <p>I urge you to consider the unacceptable and avoidable environmental impact these plans will have if not revised.</p> <p>This section is editable for you to add your own sign-off and personalise your email, doing so will increase its impact. Tell Southern Water about how their plans to over-abstract water from rivers in southern</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Regarding transparency, our Statement of Exclusion published on our consultation web page (see below) detailed those documents that were not published online due to material being commercially sensitive, or restricted under section 37(B) of the Water Industry Act 1991, or 'the Act' (as amended by the Water Act 2003). We are required to make sure that all published documents comply with the Security and Emergency Measures Direction (SEMD). Restricted documents/ sections are available for view via appointment in our head office in Worthing. For the fdWRMP24 we are making as many of the documents available on our website as possible although some information has been redacted so as to comply with SEMD and, in line with guidance, we do not publish any material of a commercially confidential nature.</p> <p>The information provided in many of the documents is very technical with many requirements set out in statutory process and supporting guidance. As this is unavoidable we produced a non-technical summary document for those seeking a high level understanding of our plan. You can view the publicly available documents on the link below.<br/> <a href="https://waterresources.southernwater.co.uk/find-out-more/">"https://waterresources.southernwater.co.uk/find-out-more/"</a></p> <ol style="list-style-type: none"> <li>1) As part of our 2018 agreement with the Environment Agency under section 20 of the Water Industry Act 1991, we remain committed to using all best endeavours to deliver a long-term solution in Hampshire as soon as possible.</li> <li>2) Our plan is adaptive in nature. This means that we can switch schemes depending on the scale of population growth, climate change impacts and the amount of reduction in the volume of water we get from our existing sources. We do consider the risks in delivering the schemes selected in our plan and try to mitigate them as much as we can.</li> <li>3) We acknowledge your support for the implementation of HWTWRP in order to protect the Chalk streams. We have employed and continue to employ all best endeavours to deliver a large strategic scheme in Hampshire to prevent the use of drought permits/ orders. Initially the strategic scheme was to be a desalination plant on the Solent. However, through the Regulatory Alliance to Progress Infrastructure Development (RAPID) gated process, we undertook an options appraisal process that investigated alternative options. We considered a range of environmental and planning criteria, alongside the delivery of our legal obligations to rank the different options. These also included: alternative water recycling schemes; a transfer from the West Country and a direct pipeline from Havant Thicket reservoir to our Hampshire supply area. We found the desalination plant was the lowest ranked of the options, so we are not progressing it any further. This decision was supported by our regulators. We continued investigating options for a water recycling scheme and pipeline and this led to the development of the Hampshire Water Transfer and Water Recycling Project (HWTWRP).</li> <li>4) As the environmental regulators of the water industry, the Environment Agency and Natural England have provided detailed comments regarding the Environmental Assessments for the WRMP. Work is being undertaken by our consultants WSP to address these comments and make any necessary changes to ensure that the assessments align with regulatory requirements.</li> </ol> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | 5) Please see answer to 5).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| WRMP1033  | <p>I read with concern Southern Waters revised WRMP 24 revised plan and unfortunately note that, regarding building an effluent recycling plant at [REDACTED] [REDACTED] [REDACTED] nothing has changed. I am unable to comment on the proposals that SWA have to supply other areas from sources other than the new Havant Thicket reservoir except to conclude that estimates of the likely demand in 50 years time ,are highly speculative. Plans should be realistic and limited to the Next 10 years.</p> <p>Why does Southern Water want to build [REDACTED] [REDACTED] Waste Water Recycling Plant.?</p> <p>If SWA had sufficient winter storage and managed leakage, consecutive dry winters would not be a problem.</p> <p>The problem that Southern Water has, is the limit of abstractions from the Rivers Itchen and Test. Should for example flow in the Itchen fall below 194M/ltrs/day for EA environmental reasons, abstraction must stop.</p> <p>A possible solution is to capture some , say 50% of this flow just before it gets into the sea and return it back into the Treatment Plants then,River (or aquifer) higher up stream.</p> <p>{A sheet piled curtain wall and a variable height weir may be required to prevent salt water infiltration and of course the necessary pumps and pipeline.}</p> <p>The construction and energy and running costs should be a fraction of those of the [REDACTED] [REDACTED] proposal because the distances are so much shorter.</p> <p>Currently Portsmouth Water can supply 15M/lt/day to Southern Water to the West .and can supply up to a further 75M lt/day when Havant Thicket Reservoir is completed without the need for costly recycled waste water from [REDACTED] [REDACTED]</p> <p>Now let us consider the [REDACTED] [REDACTED] proposed recycling plant</p> <p>I was fortunate to attend a recent webinar by Dr Marc Pichou who explained the reverse osmosis process very well.</p> <p>In countries where water is in short supply, recycling can no doubt provide a solution but it is clearly technically very demanding, requires disinfectant(hydrogen peroxide) and other chemicals and lots of energy. In addition he says plants have to operate at least at 30% of capacity 24/7 whether needed or not!</p> <p>The [REDACTED] [REDACTED] plant would need to process a minimum flow rate of 30M/ltr/day!!</p> <p>How many successful WWRP are operating in the UK at present?</p> <p>The site proposed is a former tip and is adjacent to the environmentally sensitive Langstone Harbour. Avoiding contamination will prove difficult and expensive.</p> <p>Why are we here?</p> <p>One only has to look at recent rain fall figures to conclude that there are no shortages of water resources on this part of the South Coast.</p> <p>The problem is caused by the mismanagement of the existing resources in the area.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback. Your objection to the use of recycled water in Havant Thicket is noted.</p> <p>For dWRMP24 we, together with the other WRSE companies, commissioned Edge Analytics to provide growth forecasts for all companies, in line with government guidelines. Edge Analytics used the latest available local plan data, as well as data from the Office for National Statistics (ONS) and the Greater London Authority (GLA), to produce projections at a WRZ level. Separate forecasts were developed for total population, household population, non-household population, dwellings, dwellings occupancy, population in commercial properties and business counts. Following the publication of latest WRPG in March 2023, we commissioned an update to that forecast (along with other WRSE companies), which enabled us to consider growth under five different projections based on data from Local Authorities, ONS and OxCam. We have not based our plan on a single population forecast but have used a range of population forecasts to determine the nine future supply-demand balance scenarios that we have planned for (see Section 5.5.3 of the rdWRMP24 Technical Report). The estimates of future population growth range is from 7% to 34% growth at the company level between 2025 and 2075. The range of growth forecasts considered each of our WRZs is shown in Section 2 of Annex 7 that accompanied rdWRMP24 Technical Report. As part of our adaptive planning approach, we will track population growth and switch to the most appropriate supply-demand balance situation.</p> <p>A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning. Regarding moving abstraction points closer to the sea, we have considered such options. One of the complications with moving abstractions close to sea is the impact of tides on the duration of abstraction and water quality. We will be exploring them further for our next plan.</p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water. Supplementing the reservoir with purified recycled water will create a new sustainable source of supply.</p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|           | <p>More winter rainfall needs to be captured and stored in aquifers and reservoirs. Less water needs to be lost or wasted through leakage.<br/>Demand needs to be controlled.<br/>Expensive clean water must not be allowed to leak out of the pipework.<br/>Currently 19% of expensive processed water, leaks from the SWA distribution system!<br/>More consideration needs to be applied to PRV pressure control of the distribution network particularly at night.<br/>At least 1.0 % of the network needs replacing every year just to achieve the average age of pipework below 100 years!!!<br/>I note with interest that SWA blames its recent increase in leakage figures on COVID!!!<br/>To cope with future population growth, more rain water needs to be collected locally and used where high quality drinking water is not required.<br/>( This will reduce demand but may need to be a planning issue for new developments.)</p> <p>By way of introduction I am a retired Chartered Civil Engineer and from [REDACTED] have worked for Both Southern and Portsmouth Water, the partnership who are putting the WWTP plan together.<br/>I was a [REDACTED] for the construction of [REDACTED] Waste Treatment Plant, The [REDACTED] Treatment Plant and Contracts Engineer for Portsmouth waters mains renewal programme.<br/>I understand the need for investment in the Water Industry( which has given me a good living,) but I fear on this occasion Southern Waters Proposals are more in the interests of its investors, than its customers.<br/>What ever plans are finally approved by Defra, Southern Water will inevitably use them to justify very substantial customer price rises, when negotiating with OFWaT<br/>Were the price rises awarded in the past used to invest properly in SWA infra structure?<br/>Judging by their recent failures, I think not!!<br/>I continue to support the Havant Thicket Reservoir proposal and the supply of surplus Spring water to SWA.<br/>We can do without extravagant Waste Water recycling.</p> | <p>landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>We are planning to build two reservoirs; the Havant Thicket Reservoir with Portsmouth Water and SESRO together with Thames Water and Affinity Water. Our plan also includes provision for building another one in Sussex. We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. We have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>We consider that current water mains have an average asset life of approximately 100 years. If 0.5% of mains are renewed each year this would mean that, on average, a main is expected to last for 200 years. There are different views in the water sector on the appropriate rate of mains renewal and the amount of investment needed on asset health overall. Our economic regulator Ofwat in its December 2024 final determinations published a roadmap for enhancing understanding of asset health in the sector <a href="https://www.ofwat.gov.uk/publication/pr24-final-determinations-roadmap-for-enhancing-asset-health-understanding-in-the-water-sector">https://www.ofwat.gov.uk/publication/pr24-final-determinations-roadmap-for-enhancing-asset-health-understanding-in-the-water-sector</a> It is too early to say what the outcome of that work will be in relation to future rates of mains renewal.</p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history. It should be noted that Southern Water has temporarily suspended dividends to shareholders and has not paid dividends since 2017. Also, the £1.6 Billion investment funding received from Macquarie Asset Management has been paid to Southern Water Group and none of this amount has been paid to previous shareholders.</p> |
| WRMP1034  | <p>To DEFRA<br/>As a resident of Havant Borough, I have various concerns about the SW proposals for an effluent recycling plant being built to provide the Havant reservoir with water. More sustainable,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|           | <p>environmentally friendly options which work with predicted climate changes should have been more robustly assessed and included in the SW revised draft plan.</p> <p>Given likely spiralling costs which always occur with this type of construction plan, likely programme delays, significant environmental effects, the need to operate 365 days a year, lack of legacy and short lifespan, the Hampshire effluent recycling scheme cannot represent best value for customers.</p> <p>The selection of effluent recycling via Havant Thicket and transfer 40km to [REDACTED] results in unacceptably high carbon impact and greenhouse gas emissions. In addition, the SW Preliminary Environmental Information Report (2024) confirmed a likely significant effect on the marine environment from the Hampshire effluent recycling scheme.</p> <p>Moving abstractions to the lower catchment of rivers should be prioritised for investigation as a sustainable and environmentally friendly solution across the region.</p> <p>Instead of the effluent recycling plant, SW should start immediate work on delivery of the groundwater borehole schemes and Test Managed Aquifer Recharge Scheme in Hampshire, as they require minimum infrastructure and are within the company's control. The investigation of other aquifer storage schemes in Hampshire, the IOW and West Sussex should be prioritised to establish the yield they could provide. This is essential and should be funded urgently so that these schemes can be included as feasible options. Also, SW need to work on the capture of more winter rain for use in dry summers.</p> <p>No work is taking place to ensure the alternative Hampshire effluent recycling option using [REDACTED] and a bespoke environmental buffer lake are advanced as a back-up, despite this work having been allocated funding by Ofwat. Nor is there any reference to further investigation of a combined Portswood and [REDACTED] scheme; a scheme previously indicated to be feasible with sites that are closer to where the water is needed.</p> <p>Multiple cheaper and more sustainable schemes than effluent recycling have been rejected by SW because they 'cannot be delivered in time', according to SW. Presumably, this means by 2030. Yet the effluent recycling scheme in Hampshire which will supply both Hampshire and West Sussex cannot be delivered until 2035 either, and that timescale will almost certainly slip further. SW are only looking at one option. Surely it is better, more resilient and more sustainable to develop multiple smaller schemes, close to where the water is needed, many of which do not even require new consents, just treatment plant or borehole upgrades.</p> <p>Also, an option proposed by SW for when there is a drought, was to tanker-in water from Norway. Bringing water from Norway cannot be accepted as a credible drought plan under any circumstances. The economic and detrimental environmental impacts make the suggestion laughable.</p> <p>I request that you reject the SW proposal and instruct them to construct a plan that is more sustainable, environmentally friendly and better value for their customers.</p> <p>Thank you for taking the time to consider my response.</p> | <p>The Havant Thicket Reservoir was selected in WRMP19, has been through a separate consultation process and we are progressing with its delivery, so this scheme is not new to WRMP24. The cost for the Havant Thicket Reservoir is included in the Water Resources Planning tables that accompany our plan. Annex 12 to our rdWRMP24 listed all options considered for WRMP24, including those that were not taken forward for a more detailed assessment (Section 3 of Annex 12).</p> <p>We carry out an options appraisal exercise when we update our plan every 5 years. This exercise is usually carried out by an external consultant and looks at new options as well as options that were previously considered but were not taken forward for a variety of reasons. Cost is one of the factors considered in the options appraisal process but is not the only determining factor. We have also looked at factors such as volume of water that an option can provide, its resilience to climate change, environmental impact etc. in addition to capital and operating costs. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</p> <p>As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible.</p> <p>We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy. Sea tankering from Norway is no longer included in our plan.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction</p> |

| Reference | Feedback | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |          | <p>licences on the whole river and groundwater system and because of the impact on migratory fish. A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We are planning to build new reservoirs where feasible. This includes the Havant Thicket Reservoir, the South East Strategic Reservoir Option (SESRO) and the River Adur Offline Storage. However, these will be insufficient to provide the volume of water to meet supply-demand balance in future. The HWTWRP is needed to provide the additional volume needed to maintain supply-demand balance and also offers greater resilience in the event of a prolonged drought. We will continue to explore options for additional reservoirs across our supply area for our next plan.</p> <p>Using the reservoir to store purified recycled water has been selected as the optimum way of making up a large part of the shortfall we face in Hampshire. Pumping 60 million litres of water a day into the reservoir will allow up to 90 million litres a day to be taken during a drought. A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations. Water recycling is widely used around the world to create a new source of supply that means less water needs to be taken from the environment supporting wildlife, particularly in a drought. Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were. Water from the water recycling plant will be used all year round to supply Southern Water customers, following further environmental restrictions including abstraction limitations from Natural England's Common Standards Monitoring Guidance conditions. These conditions set new year-round flow targets for the River Itchen and proposed targets for future implementation on the River Test, reducing the water available, both in the summer and winter.</p> <p>Work formally paused on investigating and developing Fareham Wastewater Treatment Works as a back-up option in May 2023, in agreement with RAPID, and so we have not developed it to the same level as HWTWRP. A Back Up option was also identified. This involved transfer of recycled water from a water recycling plant to Itchen WSW via an environmental buffer. Desalination options were removed from further consideration at this stage. The outcome of the options appraisal process was supported by RAPID at Gate 2. Although both HWTWRP and the Back Up option were able to meet requirements of supplying 75Ml/d in the Western Area (as required by WRMP19), and were able to meet the identified future need of up to 90Ml/d, HWTWRP presented significantly better value for customers and was better able to meet long-term regional supply requirements due to improved adaptability. Therefore, the focus was on progressing HWTWRP as the selected option.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | There are regulatory and statutory requirements for public water supply to be more resilient to droughts and to meet additional demands associated with growth and development. The HWTWRP will address these demands by re-using water that has already been used for public supply, rather than taking more water from the environment during times of low flows. The temporary option to ship in water from Norway (between 2031-2034), is no longer included in our plan.                                             |
| WRMP1035  | I write to object to Southern Water's latest options for converting Sewage to drinking water at our new Havant reservoir. I believe that Southern water suffer from a lack of clear sightedness and are most definitely not listening to their client base. It is utterly clear that they are scrambling to catch up from a lack of investment and hence updating of resources. They have allowed the extremely weak leadership and management by OFWAT to give them space to under-perform and attract ridiculous fines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Thank you for reviewing our rdWRMP24 and providing feedback.<br><br>We thank you for your engagement and feedback with our rdWRMP24 consultation. Your objection to the use of recycled water in Havant Thicket has been noted. Our website will provide details on our WRMP24 and, going forward, our WRMP29.                                                                                                                                                                                                            |
| WRMP1036  | <p>Good Day Defra</p> <p>With regard to the Southern Water revised draft Water Resources Management Plan by Southern Water -</p> <p>I strongly object, so am emailing you as a 79 year old drinking Portsmouth Water all my life and Southern Water 'dealing with waste water'</p> <p>I am horrified to find out that Southern Water propose to recycle effluent with Portsmouth Water and store in Havant Thicket Reservoir which is a new reservoir created originally by Portsmouth Water. Since Southern Water contaminated our seas which we can no longer swim in and now they propose for us to drink recycled water in the future !</p> <p>This is a very devious plan they trying to get through without sharing this plan with the local population!</p> <p>Every day Southern Water waste so much 'leaked' rain water , it should be stored in aquifers there would then be no need for recyling if managed correctly !</p> <p>Apparently 3 winter storage reservoirs could be built for the cost of the whole effluent recycling scheme.</p> <p>and to tanker water from Norway is outrageous with extra costs of shipping etc etc</p> <p>Please see below 40 detailed reasons why Southern Water should not proceed as they not reliable</p> <p>with best wishes for your attention</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>1) With regard to storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Southern Water Response (For more detail refer to item C below</p> <p><a href="https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrmp2024%2F%23C&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930524211%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIsIlAiOiJXaW4zMtIklkFoljoiTWfPbCisldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=DeeeKqLpxJoldCxIT1xPcnh%2B%2F2jKM4R3ddYiLfpP3Q%3D&amp;reserved=0">https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrmp2024%2F%23C&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930524211%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIsIlAiOiJXaW4zMtIklkFoljoiTWfPbCisldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=DeeeKqLpxJoldCxIT1xPcnh%2B%2F2jKM4R3ddYiLfpP3Q%3D&amp;reserved=0</a> .)</p> <p>8</p> <p>SW are unnecessarily pessimistic in their assumptions regarding population growth and this is driving a large demand deficit. The information provided is also contradictory with Annex 7b forecasting 23.56% growth and Annex 14 referring to a 17% increase by 2050. Surely that level of population growth is not credible. (For more detail refer to item D below</p> <p><a href="https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrmp2024%2F%23D&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C63867528193055420%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIsIlAiOiJXaW4zMtIklkFoljoiTWfPbCisldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=VaqumA4n9ZWRgvCFDAoiK0bUoAdZXR8tkoaY6Kn3dj8%3D&amp;reserved=0">https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrmp2024%2F%23D&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C63867528193055420%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIsIlAiOiJXaW4zMtIklkFoljoiTWfPbCisldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=VaqumA4n9ZWRgvCFDAoiK0bUoAdZXR8tkoaY6Kn3dj8%3D&amp;reserved=0</a> .)</p> <p>9</p> <p>Assuming high levels of abstraction reform is over precautionary when what will be required in future is currently very uncertain as SW environmental studies are still ongoing. This is driving a large demand deficit which helps SW justify their unsustainable effluent recycling schemes. (For more detail refer to item D below</p> <p><a href="https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrmp2024%2F%23D&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930567308%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIsIlAiOiJXaW4zMtIklkFoljoiTWfPbCisldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=2qSwN4OJnuGK6miEdJRRMf0rbCAkmO4XwXdxR8Fohil%3D&amp;reserved=0">https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrmp2024%2F%23D&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930567308%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIsIlAiOiJXaW4zMtIklkFoljoiTWfPbCisldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=2qSwN4OJnuGK6miEdJRRMf0rbCAkmO4XwXdxR8Fohil%3D&amp;reserved=0</a> .)</p> | <p>the new schemes, the reliance on some drought options (e.g. the River Test Drought Permit) is essential because, without it, there would be insufficient supply to meet the demands of thousands of our customers in Hampshire. We discuss the changed delivery dates in Section 6.3.4 of our rdWRMP24 Technical Report.</p> <p>7) With regard to the viability of sea tankering, this option is no longer included in our plan.</p> <p>8) For dWRMP24 we, together with the other WRSE companies, commissioned Edge Analytics to provide growth forecasts for all companies, in line with government guidelines. Edge Analytics used the latest available local plan data, as well as data from the Office for National Statistics (ONS) and the Greater London Authority (GLA), to produce projections at a WRZ level. Separate forecasts were developed for total population, household population, non-household population, dwellings, dwellings occupancy, population in commercial properties and business counts. Following the publication of latest WRPg in March 2023, we commissioned an update to that forecast (along with other WRSE companies), which enabled us to consider growth under five different projections based on data from Local Authorities, ONS and OxCam. We have not based our plan on a single population forecast but have used a range of population forecasts to determine the nine future supply-demand balance scenarios that we have planned for (see Section 5.5.3 of the rdWRMP24 Technical Report). The estimates of future population growth range is from 7% to 34% growth at the company level between 2025 and 2075. The range of growth forecasts considered each of our WRZs is shown in Section 2 of Annex 7 that accompanied rdWRMP24 Technical Report. As part of our adaptive planning approach, we will track population growth and switch to the most appropriate supply-demand balance situation.</p> <p>9) The government has set a 25 Year Environment Plan target of 75% of waters to be close to their natural state. Abstraction reform plays a key part in this plan. Sustainable water abstraction is essential to ensure that river flows and groundwater levels support ecology and</p> |

|           | <p>Assuming no abstraction at all even in winter from the rivers Itchen and Rother is not appropriate and over precautionary. (For more detail refer to item E below<br/> <a href="https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23E&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930584546%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIwLjAuMDAwMCIsIlAiOiJXaW4zMtIiIsIkFOljoIjTWFPbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=hfJCNMI5XNgmbs0RADVQCHZH2I5D7WL5tqifnqgro3w%3D&amp;reserved=0">https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23E&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930584546%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIwLjAuMDAwMCIsIlAiOiJXaW4zMtIiIsIkFOljoIjTWFPbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=hfJCNMI5XNgmbs0RADVQCHZH2I5D7WL5tqifnqgro3w%3D&amp;reserved=0</a> .)</p> <p>10</p> <p>SW lose 100 million litres of water every day to leaks, that is 19% of all the water they abstract from the environment, which customers pay to treat, wasted through leakage in their distribution system. Yet their slow programme for improvements means even by 2050 they will still be leaking about 10% of all the water they treat, including the new water manufactured at huge cost from their planned new effluent recycling schemes. Without a more ambitious mains replacement programme they will never get leakage under control.</p> <p>An industry leakage specialist tells us that if Southern Water prioritised and funded leakage reduction they could strive to achieve a 50% reduction by 2040 and a 70% reduction by 2050, rather than the 53% leakage reduction target they have set themselves by 2050.</p> <p>11</p> <p>SW have not taken account of the completion of the Hampshire Grid improvement programme which will be available from 2030 to rezone the Western supply area. The Company option review and selection process is based on individual supply zones. Taking account of the increased ability to transfer water within Hampshire by merging existing zones could have changed the options appraisal process. (For more detail refer to item F below<br/> <a href="https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23F&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930597345%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIwLjAuMDAwMCIsIlAiOiJXaW4zMtIiIsIkFOljoIjTWFPbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=TN%2FU9425jPXKcVdIU8R8f7hbIOVUGnP%2BNQM8zqulcyl%3D&amp;reserved=0">https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23F&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930597345%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIwLjAuMDAwMCIsIlAiOiJXaW4zMtIiIsIkFOljoIjTWFPbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=TN%2FU9425jPXKcVdIU8R8f7hbIOVUGnP%2BNQM8zqulcyl%3D&amp;reserved=0</a> .)</p> <p>12</p> <p>The investment model is not fit for purpose it needs to be urgently revised so that it does not preferentially select the use of drought options/permits. The model needs to be able to preferentially select smaller more sustainable options, whereas it currently favours large infrastructure schemes which should be a last resort once more sustainable options have been exhausted. (For more detail refer to items K and L below<br/> <a href="https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23K&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930613483%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIwLjAuMDAwMCIsIlAiOiJXaW4zMtIiIsIkFOljoIjTWFPbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=23pTuX%2BpayYpZCPPEX62lktwhE1DwRMRnlgQgrbBK1M%3D&amp;reserved=0">https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23K&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930613483%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIwLjAuMDAwMCIsIlAiOiJXaW4zMtIiIsIkFOljoIjTWFPbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=23pTuX%2BpayYpZCPPEX62lktwhE1DwRMRnlgQgrbBK1M%3D&amp;reserved=0</a> .)</p> <p>13</p> | <p>natural resilience. Since 2008 the Environment Agency has made changes to over 270 abstraction licences to prevent over 30 billion litres of water per year being removed from the environment where abstraction is unsustainable.</p> <p>Water companies, through their WRMPs, need to plan for future deficits in supply generated by reductions in abstraction licences. Through the Water Industry National Environment Programme (WINEP), studies and investigations are ongoing to understand the environmental impact of our current licences. Any future licence changes are informed by the conclusions of these WINEP environmental studies.</p> <p>10) The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>11) We have fully accounted for the availability of the Hampshire Grid and the flexibility it offers in moving water around Hampshire. However, the grid will deliver its optimum benefit where there is sufficient water available in Hampshire to transfer across the area. This will require the completion of the Havant Thicket Reservoir and the HWTWRP.</p> <p>12) The investment model needs to objectively select options based on standardised input criteria. It cannot be configured to preferentially select either smaller or larger options as that will lead to biased results and it cannot be demonstrated that the preferred plan is either least</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

This is not mentioned as an option that has been considered in the SW Technical Report, nor Annex 20.</p> <p>20</p> <p>In the future SW indicate they will work with stakeholders to look at moving the abstraction on the River Adur to the estuary (transitional waters) to allow more abstraction (Annex 20, page 30-31) but this is not in the current plan. Moving river abstractions to the tidal limit can have environmental benefits, restoring more natural freshwater flows in rivers to protect the ecology. This scheme should be selected now and prioritised as a more sustainable solution. (Why is the solution of moving abstractions to the lower catchment of rivers not being prioritised for investigation as a more sustainable solution across the region?)</p> <p>21</p> <p>More challenging targets must be set for delivery of the groundwater borehole schemes and Test Managed Aquifer Recharge Scheme in Hampshire, as they require minimum infrastructure and are within the company's control. Investigation and delivery should commence in 2025 to ensure these schemes are delivered as quickly as possible, to provide at least 13.8 Ml/d to help better manage resources in the catchments and protect the rivers Test and Itchen from drought orders. We need Defra and the regulators to strongly challenge on this to ensure a quicker delivery date. (For more detail refer to item H below <a href="https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwmp2024%2F%23H&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930685737%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIsIlAiOiJXaW4zMlslkFoljoiTWfPbClslldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=V46UmpOuFpadxeobGAOPLvU3ozkITzErupF9iFwELik%3D&amp;reserved=0">https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwmp2024%2F%23H&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930685737%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIsIlAiOiJXaW4zMlslkFoljoiTWfPbClslldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=V46UmpOuFpadxeobGAOPLvU3ozkITzErupF9iFwELik%3D&amp;reserved=0</a> .)</p> | <p>18) Noted</p> <p>19, 20) We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish. One of the complications with moving abstractions close to sea is the impact of tides on the duration of abstraction and water quality. We will be exploring them further for our next plan.</p> |

## Water Resources Management Plan 2024 Statement of Response

### Annex 3: Our responses to feedback from the general public

| Reference | Feedback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                  |

| 22        | <p>The investigation of other aquifer storage schemes in Hampshire, the IOW and West Sussex is not being prioritised to establish the yield they could provide. This is essential and should be prioritised and funded urgently so that these schemes can be included as feasible options. (For more detail refer to item G below</p> <p><a href="https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23G&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930701503%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIslAIjXaW4zMlslkFOljoITWFpbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=YW%2FQA%2Fg5Z7rDbQ5k6%2FeXLq59FK5%2BDD4uBE8C3sQcl8%3D&amp;reserved=0">https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23G&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C638675281930701503%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIslAIjXaW4zMlslkFOljoITWFpbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=YW%2FQA%2Fg5Z7rDbQ5k6%2FeXLq59FK5%2BDD4uBE8C3sQcl8%3D&amp;reserved=0</a> .)</p>                                                                                                                                          | <p>21) A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> |
| 23        | <p>Proposed schemes to recycle water currently wasted at the [REDACTED] and Test Surface Water WSW should be prioritised more urgently to help minimise abstraction on the Test and Itchen all the time, not only in a drought (Annex 20, page 32).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>22) Our plan includes two groundwater schemes on the IOW to provided up to 3.4Ml/d 2040.</p>                                                                                                                                                                                                                                                                                                          |
| 24        | <p>No work is taking place to ensure the alternative Hampshire effluent recycling option using [REDACTED] and a bespoke environmental buffer lake are advanced as a back-up, despite this work having been allocated funding by Ofwat. Nor is there any reference to further investigation of a combined Portswood and [REDACTED] scheme. A scheme previously indicated to be feasible with sites that are closer to where the water is needed. (For more detail refer to item J below</p> <p><a href="https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23J&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C6386752819307015633%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIslAIjXaW4zMlslkFOljoITWFpbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=E0yGXxhiPXRcU9ih8wHoCwXNlqPSimc0TJ3HmrbLvY0%3D&amp;reserved=0">https://eur03.safelinks.protection.outlook.com/?url=https%3A%2F%2Fhavantmatters.org%2Fwater%2Fwrm2024%2F%23J&amp;data=05%7C02%7Cwater.resources%40defra.gov.uk%7C1f230eb56cac43fc8dda08dd07c8f753%7C770a245002274c6290c74e38537f1102%7C0%7C0%7C6386752819307015633%7CUnknown%7CTWFpbGZsb3d8eyJFbXB0eU1hcGkiOnRydWUsIlYiOiIlwLjAuMDAwMCIslAIjXaW4zMlslkFOljoITWFpbCIsIlldUljoyfQ%3D%3D%7C0%7C%7C%7C&amp;sdata=E0yGXxhiPXRcU9ih8wHoCwXNlqPSimc0TJ3HmrbLvY0%3D&amp;reserved=0</a> .)</p> | <p>23) With regard to prioritisation of recycling water at Itchen WSW, as noted in the rejection register against these schemes, enhancements to treatment process are needed at these sites to reduce process losses. These would be considered for WRMP29.</p>                                                                                                                                         |
| 25        | <p>Negotiations with a very large industrial water user in South Hampshire should have been brought forward as a priority, to explore alternative supply options when the contract expires in 2026, to free up drinking water for SW customers in a drought (Annex 20, page 6) and provide more certainty for the plan.</p> <p>Could a desalination plant that trials research into alternative technology, potential uses for the hyper saline solution and reducing energy consumption be a way forward for this site (Annex 20, page 30 refers) perhaps in partnership with industry.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>24) We are focussed on delivering the HWTWRP by 2033-34. The alternative option to use Fareham for recycling water has not been shelved but is put on hold.</p>                                                                                                                                                                                                                                       |
| 26        | <p>In West Sussex the need for network upgrades is being used as an excuse not to bring forward schemes at existing works that would increase supply (Annex 20, Appendix A). If all of these schemes rejected for this reason were brought forward, they could deliver more than 20Ml/d of water to the Central Region. This is more water than is to be provided by the proposed Littlehampton (Ford) effluent recycling scheme which will discharge to the Western Rother. The</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                          |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

----------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>necessary network upgrades in West Sussex should form part of the plan. Network upgrades are taking place in Hampshire to address such concerns, why not in West Sussex?</p> <p>27</p> <p>Across the Western and Central Area the fact that sources ‘might not be available in a drought’ is being used by SW as an excuse not to increase capacity at existing water treatment works. If the works were upgraded they could be used at higher capacity during normal operation, leaving other groundwater sources that would be available in a drought to rest or be used less, so that more groundwater is available in a drought. Schemes to increase capacity at existing works could deliver 18 Ml/d of water across the region and these options should be prioritised. However, SW are less likely to find this an attractive option where the source is surface water because it is cheaper to treat and supply groundwater every day. SW need to plan to use their water sources in a more sustainable way that works with climate change, not just use the cheapest sources first.</p> <p>28</p> <p>Multiple cheaper and more sustainable schemes have been rejected by SW because they ‘cannot be delivered in time’ (presumably this means by 2030).</p> <p>17 schemes in Hampshire and IOW (Western Area) could deliver at least 42 Ml/d.</p> <p>7 schemes in West Sussex (Central Area) could deliver at least 18 Ml/d</p> <p>Yet the effluent recycling scheme in Hampshire which will supply both Hampshire and West Sussex cannot be delivered until 2035 either, and that timescale will almost certainly slip further. SW are putting all of their ‘eggs in one basket’. Surely it is better, more resilient and more sustainable to develop multiple smaller schemes, close to where the water is needed, many of which do not even require new consents, just treatment plant or borehole upgrades.</p> <p>29</p> <p>SW are still not urgently investigating and bringing forward additional new reservoir schemes in the short to medium term, despite this being customers preferred choice. The delivery of the River Adur project is not scheduled until 2039/40, no other reservoir schemes are in the pipeline in Hampshire or West Sussex in the revised draft plan.</p> <p>30</p> <p>Groundwater schemes on the Isle of Wight (IOW) are not brought forward as the water gained cannot be transferred to the mainland to help the rivers Test and Itchen in a drought (Annex 20, page 5-6). However, if implemented they would reduce the amount of water that needs to be transferred from Southampton to the IOW providing a benefit that should be pursued.</p> <p>31</p> <p>The timescale for delivery of ten years should not be seen as a valid reason to reject provision of a bi-directional link between the IOW and the mainland, especially as it could allow water to be used more flexibly in a drought, including use of future spare water from Sandown.</p> <p>32</p> <p>There has been little proactive work by SW to investigate buying or trading licences with private supply users across the region. In a restricted document supporting the previous draft plan it indicated buying just one licence could deliver 19.7 Ml/d. There should be more proactive investigation and negotiation by SW to buy existing private abstraction licences, this in turn</p> | <p>25) We will be exploring the option of amending the bulk supply agreement with a large industrial user in HSW WRZ when the existing contract expires in 2026. However, we are not planning to consider any changes to the bulk supply agreement for WRMP24.</p> <p>26) Network enhancements in the Central area were not taken forward as the required enhancements could not be delivered by 2030. These will be reconsidered for WRMP29.</p> <p>27) The amount of water we can abstract from river and groundwater sources are determined by our abstraction licences, which typically specify the maximum amount of water we can take from a source over a year with a limit set on maximum daily abstraction. We cannot take unlimited amount of water from these sources during wet periods.</p> <p>28) Notwithstanding the fact that these 17 schemes are not explicitly identified in this query, there is little benefit in developing 17 schemes by the 2030s when the three schemes we are progressing will deliver the over twice the volume over a similar timeframe. We did not simply reject schemes because they could not be delivered by 2035. Only the schemes that were considered to mitigate the use of drought permits and orders beyond 2030 had to meet the criterion of being deliverable by 2030, because schemes delivered after 2030 would not be able to mitigate the reliance on drought permits and orders beyond 2030.</p> <p>29) We have looked at over 50 reservoir options as part of our options appraisal process over the last 3 WRMP cycles. These are not taken forward due to environmental concerns that will make it difficult to get planning permission. However, we review these options for each WRMP cycle and will review them again for WRMP29.</p> <p>30) Our plan includes two groundwater schemes on the IOW to provided up to 3.4Ml/d 2040.</p> |

|           | <p>“ SW did not follow the legal requirement for a new statutory consultation on their plan when there was a material change to the option(s) selected in 2021, when the [REDACTED] desalination scheme was rejected, and the WRMP19 back-up option of discharging recycled effluent to the River Itchen was also rejected. When there was a material change to the plan in 2021 SW should have undertaken a comprehensive review of all the available options and a full public consultation. This did not happen.</p> <p>“ As a result, communities in the areas affected by the selected options did not have the opportunity to comment at the “formative stage”™ of the plan, before the new effluent recycling options were selected.</p> <p>“ At the time of previous consultations (2020 to 2022) posters were not even placed at sites impacted to make local communities aware that a consultation was taking place. Nor have posters been placed at impacted sites for this Autumn 2024 consultation.</p> | <p>non-technical summary document for those seeking a high level understanding of our plan. You can view the publicly available documents on the link below.</p> <p><a href="https://waterresources.southernwater.co.uk/find-out-more/">https://waterresources.southernwater.co.uk/find-out-more/</a></p> <p>37) We consulted extensively with our customers and stakeholder before publishing our dWRMP24 and solicited their views on the different option types. However, we have a statutory duty to maintain uninterrupted supply of water in all but the most extreme weather conditions, which may mean selecting options less preferred by customers.</p> <p>38) The water quality modelling and assessments undertaken so far have shown that there are unlikely to be any ecological or biodiversity impacts in the Solent from the water recycling process. Water quality in the reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025.</p> <p>39) Our consultation engagement with our customers and stakeholders is described in Annex 5 of our rdWRMP24 Technical Report.</p> <p>In addition to publishing the majority of our rdWRMP24 documents on our website, we arranged 8 roadshows across our supply area during October-November; 3 in our Western area, 2 in our Central area and 3 in our Eastern area. Southern Water staff were available at these roadshows to answer any questions on our rdWRMP24. Hard copies of our rdWRMP24 Technical Report and Non-Technical Summary of our plan were also available for attendees to view and take with them. In addition, we provided 5 area-specific webinars of 75 minutes duration each whereby we presented key features of our plan during the first 35-40 minutes with the remaining time allocated to Q&amp;A.</p> <p>We released a press release regarding the consultation, which was picked up by major newspapers; The Guardian and the Financial Times. We produced both targeted and non-targeted adverts on social media. We also publicised the consultation in our newsletter which, went out to all of our customers. MPs, Stakeholders and previous responders were all directly emailed regarding the consultation.</p> <p>With regard to the requirement for a full statutory consultation following the removal of the West Southampton Coast desalination option, the deselection of West Southampton Coast desalination was taken at Gate 1 of the RAPID process (outside of WRMP) in September 2021. Southern Water was then instructed by the Secretary of State to submit a draft WRMP in June 2022 (compared to October 2022 for other water companies), beginning in 2023 and covering 27 rather than 25 years. We consulted on our draft Water Resource Management Plan 2024 (dWRMP24) in 2022-2023 and, following changes, we consulted on our revised draft WRMP24 in 2024.</p> <p>For more information, see here:</p> |
| 40        | <p>The consultation documents are vast, very repetitive and fail to provide important information, or make it restricted and inaccessible, making it very difficult for a lay person to understand/get through the consultation reports. Is this intentional?</p> <p>Since this is a “once-in-a-generation”™ chance to address future water needs, there needs to be a more open discussion about moving to a more sustainable approach which works with predicted climate change, not against it.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p><a href="https://www.ofwat.gov.uk/regulated-companies/rapid/the-rapid-gated-process/accelerated-gate-two-submissions-and-new-solution-proposals/">https://www.ofwat.gov.uk/regulated-companies/rapid/the-rapid-gated-process/accelerated-gate-two-submissions-and-new-solution-proposals/</a></p> <p>40) We provided detailed information on our rdWRMP24 through a technical report accompanied by 22 annexes. The WMRP, by its nature, is a highly technical plan. We need to demonstrate that our plan is legally and technically compliant with the regulatory framework and that makes the use of technical terms unavoidable. However, we do try to make the plan understandable to a broad audience and therefore included a detailed glossary at the start of our rdWRMP24 main technical report. In addition, we also published a non-technical summary that highlighted key features of our plan.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| WRMP1037  | <p>Fao Secretary of State for Environment Steve Reed<br/>Introduction</p> <p>One can see why the SoS might be minded to approve this scheme. It ticks elements of the new Gov agenda -- huge infrastructure, many jobs and seemingly attractive solution to anticipated water shortages across a large area of the southeast. But it clearly falls foul of others, particularly the environmental agenda and net zero commitments.</p> <p>I, like many thousands of others, whether directly affected or not, object strongly to the proposal and urge the SoS to take heed of the many arguments against this £1.2 billion scheme.</p> <p>I summarise some of these below.</p> <p>It is the wrong scheme</p> <p>We do not need to start expensive processing of waste water. SE England is not currently water poor (and wetter winters are predicted) but some parts are water stressed because we currently store less than 2% of the free supply of rain. We also currently waste enormous amounts of treated drinking water.</p> <p>Alternatives</p> <p>There are many cheaper solutions which have not received due consideration in the proposal such as</p> <ol style="list-style-type: none"> <li>1. developing a full range of storage facilities for excess rainwater including small reservoirs, aquifers, lakes, wetlands, tanks and rain butts closer to demand.</li> <li>2. rolling out a comprehensive leak repair programme. SW currently loses 100million litres per day of purified water which is clearly unacceptable. Reducing this to 50million litres a day by 2030 would alone supply all the extra water SW is planning to provide by reverse osmosis to meet predicted need.</li> <li>3. introducing universal metering to better control consumption and waste,</li> <li>4. advising planners of the need to limit inward migration and new development so that demand for SW's services does not exceed to that which it is possible to supply.</li> </ol> <p>Environmental Problems with the Waste Water Recycling Proposal</p> <ol style="list-style-type: none"> <li>a) Impact on Langstone Harbour/Solent of <ol style="list-style-type: none"> <li>i) leach from deep drilling into the derelict industrial waste dump near [REDACTED] where the huge reverse osmosis plant is to be sited and</li> <li>ii) discharge into Langstone Harbour and Solent of the highly concentrated remaining waste products.</li> </ol> </li> <li>b) Damage by construction of the enormous pipework system through Havant to HTR and to the [REDACTED] Pumping Station (40km away).</li> </ol> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Despite perceptions that the South-East of England receives high volumes of rainfall, it is nonetheless classified as an area of 'serious water stress', see <a href="#">here</a>.</p> <ol style="list-style-type: none"> <li>1) We have considered a number of storage options including reservoirs and aquifers in the past and will reassess them for WRMP29. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). It is worth noting, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. A Chalk MAR scheme (feasibility trial) is included in our plan for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. We have been promoting the use water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</li> <li>2) The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward. All our meters going forward will be smart meters. We plan to replace all our existing meters with smart meters by 2030.</li> <li>3) Smart metering across our customer base over AMP8 underpins our demand management strategy. We plan to replace all our existing meters with smart meters by 2030.</li> <li>4) We will continuously monitor the effectiveness of our demand management initiatives and closely follow developments in this area across the UK water sector.</li> </ol> <ol style="list-style-type: none"> <li>a) SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Building on former landfill sites is commonplace and, when</li> </ol> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|           | <p>c) Carbon footprint/water quality</p> <p>i) The construction process will be carbon intensive and the year-round 24/7 energy requirement of pumping and processing will be huge.</p> <p>ii) Adding the treated wastewater to the spring water will completely change the water quality and risk pollution from the inevitable malfunctions. Further independent analysis of the impact on wildlife and locals is required.</p> <p>Process</p> <p>a) Permission</p> <p>Havant Borough Council gave approval to Portsmouth Water's plans to develop and supply a reservoir to store and redistribute excess spring water from Bedhampton as required. It was to reduce the local need for chalk stream extraction, cover drought periods and be a recreational and ecological asset to the area.</p> <p>SW are seeking to piggyback onto and massively extend this scheme by pumping treated sewage waste from [REDACTED] into the reservoir, for use by a wide range of their own customers both west and east of Havant.</p> <p>Because this scheme is designated "National Infrastructure" HBC cannot veto this proposal but their view should be paramount.</p> <p>b) Consultation</p> <p>The "public" consultation has been a sham. Neither Southern Water nor Portsmouth Water has notified their customers about this consultation. Nor we understand have parish councils or other interested parties been notified. Information for the general public has been conspicuously absent.</p> <p>4. Viability</p> <p>Trust is at an all-time low. SW is a debt ridden ailing and failing company which has consistently proved unable to provide safe wastewater disposal for its existing customers. It would surely be highly irresponsible to entrust this company with constructing and managing such a complex and costly scheme. The fact that such schemes work well elsewhere in the world is of no reassurance whatsoever.</p> <p>Conclusion</p> <p>Having taken heed of these and all the many other reasons why this proposal is flawed I am hopeful that it will be refused.</p> <p>Should however the SoS be minded to approve this scheme surely</p> <p>i) full and proper public consultation.</p> <p>ii) environmental impact assessments and</p> <p>iii) a full option appraisal</p> <p>must first be completed and results published before any final decision is made.</p> | <p>done carefully, poses little risk to the environment. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response. A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>b) Our Environmental Impact Assessment is providing a rigorous and proportionate approach to assessing and managing the effects of the Project and we're ensuring that environmental considerations inform the Project's design. We have already embedded several measures at the early design stages of the Project to avoid or minimise potential environmental effects.</p> <p>Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were. Regarding effects of recycled water on the chemistry of Havant Thicket reservoir, purified recycled water is extremely clean. Water quality in the reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025. The options and risks are assessed independently by RAPID through the Gated Process, and by Defra through the WRMP process.</p> <p>a) Using Havant Thicket reservoir to store purified recycled water has been selected as the optimum way of making up a large part of the shortfall we face in Hampshire. Pumping 60 million litres of water a day into the reservoir will allow up to 90 million litres a day to be taken during a drought. Southern Water's Gate 1 and Gate 2 submissions to its regulators in both 2020 and 2021 confirmed investigation of alternative options for both water recycling and water transfers involving Havant Thicket Reservoir.</p> <p>b) In addition to publishing the majority of our rdWRMP24 documents on our website, we arranged 8 roadshows across our supply area during October-November; 3 in our Western area, 2 in our Central area and 3 in our Eastern area. Southern Water staff were available at these roadshows to answer any questions on our rdWRMP24. Hard copies of our rdWRMP24 Technical Report and Non-Technical Summary of our plan were also available for attendees to view and take with them. In addition, we provided 5 area-specific webinars of 75 minutes duration each whereby we presented key features of our plan during the first 35-40 minutes with the remaining time allocated to Q&amp;A. We released a press release regarding the consultation, which was picked up by major newspapers; The Guardian and the Financial Times. We produced both targeted and non-targeted adverts on social media. We also publicised the consultation in our newsletter which went out to all of our customers. MPs, Stakeholders and previous responders were all directly emailed regarding the consultation. Our consultation engagement with our</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>customers and stakeholders is described in more detail in Annex 5 of our rdWRMP24 Technical Report. We have received 1176 responses as part of rdWRMP24 consultation.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| WRMP1038  | <p>Dear DEFRA,</p> <p>We are objecting strongly to Southern Water's WRMP. As residents of Hayling Island and we are very concerned that this effluent recycling scheme is totally unacceptable and inappropriate for our needs. This plan takes us in completely the wrong direction. Why are we not collecting more of our rainfall instead of spending a fortune in money and energy to recycle wastewater? Why is Southern Water not focusing on improving their leakage reduction? Why are they not replacing the ageing pipe network? Southern Water's replacement rate of just 1 in 1000 years when a water main is only designed to last 120 years is unacceptable.</p> <p>Southern Water have shown that they cannot be trusted to operate and maintain its current traditional infrastructure without causing pollution. What hope is there of Southern Water safely operating the complex advanced effluent recycling treatment technology without incident? Southern Water have a very poor track record of treatment plant and pumping station failures, they have had many prosecutions for pollution incidents and failure to take prompt action to rectify problems. The risk of pollution to the Havant Thicket Reservoir as well as damage to Langstone Harbour and the Solent is totally unacceptable.</p> <p>Southern Water need to do more to protect the environment and develop a strategy that helps them honour their commitment to be carbon neutral by 2030. Our river catchments could be protected much more quickly if they moved river abstractions closer to the tidal limit, and abstraction boreholes down the catchment, reducing the priority for abstraction reform which is driving the need for effluent recycling. Storage options need to be developed closer to where the water is needed, so that long pipelines that damage our countryside and wildlife are not required. Options need to be developed that do not have such a high carbon and emissions footprint. We need a strategy that prioritises low energy solutions, the energy alone for the</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). It is worth noting, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers. <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Southern Water Response |           | <p>Hampshire scheme will cost more than £3 million/year. With pumping and treatment needed 365 days a year, even though effluent recycling was selected as a drought resource.</p> <p>In a time of climate emergency how can Southern Water select the schemes with the highest carbon footprint and emissions?</p> <ul style="list-style-type: none"> <li>– The Hampshire and Littlehampton effluent recycling schemes have the highest negative environmental impact score of any of the options considered.</li> <li>– The effluent recycling schemes to be developed by 2035 each have a higher carbon impact than the transfer of water from Norway by sea tankers.</li> </ul> <p>The risks from developing the effluent recycling plant on a landfill are unacceptably high. If this plan were to go ahead then Southern Water must be told to find an alternative site for the recycling plant at Havant. The risk of constructing large tunnel shafts and hundreds of piles through the 13m deep contaminated landfill waste site into the chalk aquifer below adjacent to Langstone Harbour are just too great.</p> <p>DEFRA needs to change the water industry funding mechanism to stop incentivising infrastructure heavy solutions but instead to encourage development of sustainable solutions that work with climate change.</p> <p>I am very concerned that effluent recycling is not needed, the negative environmental impacts are too great, and the enormous costs to build and operate are unacceptable. I am asking DEFRA to reject the plan and require Southern Water to develop a more sustainable plan that works with climate change and which puts the environment before profit.</p> | <p>sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact. As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible. We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government’s legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy. Sea tankering from Norway is no longer included in our plan.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish. Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response.</p> <p>Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>SW has purchased “Site 72”, an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill.</p> <p>Regarding funding mechanisms, the Government launched an Independent Commission into the water sector and its regulation on 23 October 2024, led by Sir Jon Cunliffe. The Commission is part of a government review of the water industry and will report recommendations to the Government in Q2 2025 (between April and June) on how to tackle inherited issues in the water industry. We expect the Commission to make recommendations on water sector funding and an approach to infrastructure as part of its report.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| WRMP1039  | <p>I have the following concerns with Southern Water's revised plan:</p> <p>1 The plan does not strive to work with predicted changes to our climate to capture more winter rain for use in dry summers. Rainwater provides a good quality free raw water resource and we need to prioritise schemes that capture and store it for dry summers.</p> <p>2 SW have not completed a full review of the plan considering all alternative options as "a full re-appraisal exercise was not considered time or cost beneficial" (Annex 20, page 3). Given the importance of finding immediate solutions for the rivers Test and Itchen and at Pulborough, along with the large volume of objections to the options selected in the previous draft plan, a full and more robust review was essential. More sustainable options previously 'parked' by SW which work with predicted climate changes should have been more robustly assessed and included in the revised draft plan.</p> <p>3 It is clear that SW have only focused on identifying options to fill the gap as a result of the delay to recycling options in Hampshire and at Littlehampton (Annex 20, page 1 and 3) instead of seriously looking at prioritising more sustainable options.</p> <p>4 The timescales for delivery of effluent recycling options are unrealistic given their complexity and consenting requirements. Having put back the delivery year for the Hampshire effluent recycling scheme to 2034-35 in the Statement of Response, in places in the latest plan this option has now been brought forward to 2033-34. This is not realistic given the public opposition, risk of an enquiry, risks associated with bringing forward technology which is new to the UK for effluent recycling, and developing on old landfill sites, the recycling options are much more likely to be delayed further, leaving our precious and iconic chalk rivers with no solution for longer.</p> <p>5 SW proposal to continue to rely on and extend the use of the Candover Drought Option (augmentation boreholes) and drought permits (Technical Report page 138-139) should not be permitted beyond 2030. The plan extends their use up to 2034. (For more detail refer to item B below.)</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>1) With regard to storage, reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs.</p> <p>2) Following the first public consultation on WRMP24 (Nov 2022 to Feb 2023) regulators asked us to look again at potential resilience options to reduce reliance on drought options. We carried out a targeted re-appraisal exercise and that informed the Annex 20 that was part of the WRMP24 consultation in 2024. This was not a comprehensive full options re-appraisal akin to that carried out for the main plan preparation. The key criterion for the resilience options was that they had to be operational by 2030-31. This ruled out large infrastructure options with significant lead time and led to a targeted reappraisal of options.</p> <p>Having already undertaken an extensive options appraisal that looked at more than 1,000 options with WRSE, repeating this was not considered time or cost beneficial. It is not possible to carry out a full, regional review now given that the other five WRSE companies have finalised their WRMPs. As recommended in feedback to the 2024 WRMP consultation we reviewed at a high-level a select number of options that could potentially meet the much narrower objective of reducing the continued reliance on drought options during the time period before the larger strategic options are available. This work is set out in Annex 20 of our fdWRMP24 and we will continue to explore alternatives to drought permits and orders throughout the 2025-30 period to inform the next round of WRSE plans and our WRMP29.</p> <p>3) The purpose of the targeted options appraisal process for rdWRMP24 was to mitigate the impacts of a proposed extended reliance on the River Test and Candover drought options in Hampshire post 2030 and to limit the use of Pulborough surface water drought option under droughts of more than 1-in-200 year severity beyond 2030. Annex 20 to our rdWRMP24 Technical Report describes the work carried out in this regard.</p> <p>4) With regard to delivery timescales, we aim to have the Hampshire Water Transfer and Water Recycling Project operational by 2034.</p> <p>5, 6) It is our desire to 'avoid' use of drought options and become more drought resilient. We are working on this and we are making significant investments to reduce our need for the Candover/Test/ Itchen drought permits and orders. However, at the moment, as we wait for the new schemes, the reliance on some drought options (e.g. the River Test Drought Permit)</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|           | <p>6 SW should not be allowed to rely on continued use of the Candover drought option, Lower Itchen and Test drought orders, while they just wait for the Hampshire effluent recycling/ transfer scheme to be delivered as proposed (Annex 20, page 1 and 2), as it is inevitable that the Hampshire recycling scheme will be delayed further and will not be available in 2035, a more sustainable solution must be developed.</p> <p>7 Tankering water from Norway in a drought cannot be accepted as a credible drought plan. (For more detail refer to item C below).</p> <p>8 SW are unnecessarily pessimistic in their assumptions regarding population growth and this is driving a large demand deficit. The information provided is also contradictory with Annex 7b forecasting 23% growth and Annex 14 referring to a 17% increase by 2050. Surely that level of population growth is not credible. (For more detail refer to item D below.)</p> <p>9 Assuming high levels of abstraction reform is over precautionary when what will be required in future is currently very uncertain as SW environmental studies are still ongoing. This is driving a large demand deficit which helps SW justify their unsustainable effluent recycling schemes. (For more detail refer to item D below.)</p> <p>Assuming no abstraction at all even in winter from the rivers Itchen and Rother is not appropriate and over precautionary. (For more detail refer to item E below.)</p> <p>10 SW lose 100 million litres of water every day to leaks, that is 19% of all the water they abstract from the environment, which customers pay to treat, wasted through leakage in their distribution system. Yet their slow programme for improvements means even by 2050 they will still be leaking about 10% of all the water they treat, including the new water manufactured at huge cost from their planned new effluent recycling schemes. Without a more ambitious mains replacement programme they will never get leakage under control.</p> <p>An industry leakage specialist tells us that if Southern Water prioritised and funded leakage reduction they could strive to achieve a 50% reduction by 2040 and a 70% reduction by 2050, rather than the 53% leakage reduction target they have set themselves by 2050.</p> <p>Government figures indicate that Southern Water lose a further 3.2% of the water they take from the environment before it even reaches a treatment works. This shows a complete disregard by the company for just how precious water is.</p> <p>11 SW have not taken account of the completion of the Hampshire Grid improvement programme which will be available from 2030 to rezone the Western supply area. The Company option review and selection process is based on individual supply zones. Taking account of the increased ability to transfer water within Hampshire by merging existing zones</p> | <p>is essential because, without it, there would be insufficient supply to meet the demands of thousands of our customers in Hampshire in some scenarios. We discuss the changed delivery dates in Section 6.3.4 of our rdWRMP24 Technical Report.</p> <p>7) With regard to the viability of sea tankering, this option is no longer included in our plan.</p> <p>8) For dWRMP24 we, together with the other WRSE companies, commissioned Edge Analytics to provide growth forecasts for all companies, in line with government guidelines. Edge Analytics used the latest available local plan data, as well as data from the Office for National Statistics (ONS) and the Greater London Authority (GLA), to produce projections at a WRZ level. Separate forecasts were developed for total population, household population, non-household population, dwellings, dwellings occupancy, population in commercial properties and business counts. Following the publication of latest WRPG in March 2023, we commissioned an update to that forecast (along with other WRSE companies), which enabled us to consider growth under five different projections based on data from Local Authorities, ONS and OxCam. We have not based our plan on a single population forecast but have used a range of population forecasts to determine the nine future supply-demand balance scenarios that we have planned for (see Section 5.5.3 of the rdWRMP24 Technical Report). The estimates of future population growth range is from 7% to 34% growth at the company level between 2025 and 2075. The range of growth forecasts considered each of our WRZs is shown in Section 2 of Annex 7 that accompanied rdWRMP24 Technical Report. As part of our adaptive planning approach, we will track population growth and switch to the most appropriate supply-demand balance situation.</p> <p>9) The government has set a 25 Year Environment Plan target of 75% of waters to be close to their natural state. Abstraction reform plays a key part in this plan. Sustainable water abstraction is essential to ensure that river flows and groundwater levels support ecology and natural resilience. Since 2008 the Environment Agency has made changes to over 270 abstraction licences to prevent over 30 billion litres of water per year being removed from the environment where abstraction is unsustainable.</p> <p>Water companies, through their WRMPs, need to plan for future deficits in supply generated by reductions in abstraction licences. Through the Water Industry National Environment Programme (WINEP), studies and investigations are ongoing to understand the environmental impact of our current licences. Any future licence changes are informed by the conclusions of these WINEP environmental studies.</p> <p>10) The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>could have changed the options appraisal process. As the plan does mostly cover the period beyond 2030 the improved connectivity of the grid in the Western Area supply area by 2030 should have been fully considered and taken into account in the plan.</p> <p>12 The investment model is not fit for purpose it needs to be urgently revised so that it does not preferentially select the use of drought options/permits. The model needs to be able to preferentially select smaller more sustainable options, whereas it currently favours large infrastructure schemes which should be a last resort once more sustainable options have been exhausted.</p> <p>13 The possibility of market trading for 'water credits' is mentioned. This is a concern as it could create a new loophole for water companies and speculative developers to exploit to make money, while not actually doing anything to fix the problems faced.</p> <p>14 Given spiralling costs, programme delays, significant environmental effects, the need to operate 365 days a year, lack of legacy and short life-span, the Hampshire effluent recycling scheme cannot represent best value for customers. In fact, the restricted documents confirm that the Hampshire effluent recycling/ transfer scheme is almost as expensive to operate (OPEX) per megalitre as tankering water in from Norway!</p> <p>15 The selection of effluent recycling via Havant Thicket and transfer (40km) to [REDACTED] results in unacceptably high carbon impact and greenhouse gas emissions, more than double that of any other transfer or desalination scheme. In fact, the restricted documents confirmed that the Hampshire effluent recycling/ transfer scheme has a higher total carbon, average carbon emissions &amp; embedded carbon impact than sea tankering water in from Norway!</p> <p>16 SW Preliminary Environmental Information Report (2024) confirmed a likely significant effect on the marine environment from the Hampshire effluent recycling scheme. Modelling for water quality impacts on the reservoir is still not available. The scheme should not move forward until the environmental risks/impacts are known.</p> <p>17 The process of environmental assessment and screening methodology cannot be robust if unsustainable and environmentally damaging schemes like the Hampshire effluent recycling/transfer scheme get through. In fact, the Strategic Environmental Assessment confirmed that the Littlehampton Effluent Recycling scheme and Hampshire effluent recycling scheme had the highest negative impact scores, yet both of these options were selected by Southern Water.</p> | <p>this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>11) We have fully accounted for the availability of the Hampshire Grid and the flexibility it offers in moving water around Hampshire. However, the grid will deliver its optimum benefit where there is sufficient water available in Hampshire to transfer across the area. This will require the completion of the Havant Thicket Reservoir and the HWTWRP.</p> <p>12) The investment model needs to objectively select options based on standardised input criteria. It cannot be configured to preferentially select either smaller or larger options as that will lead to biased results and it cannot be demonstrated that the preferred plan is either least cost or best value. It does select drought options in preference to large infrastructure schemes and that is because drought options typically do not have large CAPEX expenditure. This is explained in further detail in Annex 20 of our rdWRMP24 (section 6).</p> <p>13) Environmental markets are one way to facilitate greater investment in environmental improvements delivered by technical solutions. A Water Saving Market (WSM) would work by facilitating trade between buyers and suppliers. A well-designed market will have clear governance and operational settings. Affinity Water are investigating the feasibility of a Water Saving Market to deliver water efficiency solutions and support water neutrality. As the only region in the UK with established water neutrality requirements, Southern Water is supporting Affinity Water in this feasibility study, together with Local Authorities from the region. Sussex North WRZ is one area proposed for the study, as an area with existing water scarcity issues and developmental pressures. SW continues to work with all stakeholders in the SNZ region to support greater understanding of water scarcity issues and explore potential solutions.</p> <p>14) Multiple options were considered during the options appraisal process that was carried out as part of the RAPID gated process to identify alternatives to West Southampton Coast desalination and the HWTWRP consistently scored higher than other options. It was approved by RAPID for adoption as the preferred Strategic Resource Option (SRO) to be progressed in Hampshire. Please see section 3.2 in our fdWRMP24 for more detailed reasoning on why West Southampton Coast desalination was not taken forward beyond RAPID Gate 2.</p> <p>Sea tankering from Norway is no longer included in our plan.</p> <p>15) Using Havant Thicket reservoir to store purified recycled water has been selected as the optimum way of making up a large part of the shortfall we face in Hampshire.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|           | <p>18 This is a short-sighted water resource plan, customers will still be paying for the effluent recycling infrastructure after it has become redundant due to the Ofwat funding mechanism. With the recycling plants expected to last just 60 years, the huge cost of constructing these schemes cannot be justified, especially as these options leave no tangible legacy for the future. The Hampshire effluent recycling / transfer scheme alone will cost at least £1.2 billion. Customers will also have to pay for the eye-watering debt generated well into the future.</p> <p>19 Moving the [REDACTED] abstraction to the tidal limit would be a better, more robust and sustainable solution to protect the whole of the freshwater catchment and restore natural flows in a drought. This is not mentioned as an option that has been considered in the SW Technical Report, nor Annex 20.</p> <p>20 In the future SW indicate they will work with stakeholders to look at moving the abstraction on the River Adur to the estuary (transitional waters) to allow more abstraction but this is not in the current plan. Moving river abstractions to the tidal limit can have environmental benefits, restoring more natural freshwater flows in rivers to protect the ecology. This scheme should be selected now and prioritised as a more sustainable solution. (Why is the solution of moving abstractions to the lower catchment of rivers not being prioritised for investigation as a more sustainable solution across the region?)</p> <p>21 More challenging targets must be set for delivery of the groundwater borehole schemes and Test Managed Aquifer Recharge Scheme in Hampshire, as they require minimum infrastructure and are within the company's control. Investigation and delivery should commence in 2025 to ensure these schemes are delivered as quickly as possible, to provide at least 13.8 MI/d to help better manage resources in the catchments and protect the rivers Test and Itchen from drought orders. We need Defra and the regulators to strongly challenge on this to ensure a quicker delivery date. (For more detail refer to item H below.)</p> <p>22 The investigation of other aquifer storage schemes in Hampshire, the IOW and West Sussex is not being prioritised to establish the yield they could provide. This is essential and should be prioritised and funded urgently so that these schemes can be included as feasible options. Aquifer storage has been successfully used for many years across the world, including in California and in the Thames Basin (UK). Tests in Dorset have previously shown that aquifer storage and recovery is feasible in confined sections of the chalk.</p> <p>23 Proposed schemes to recycle water currently wasted at the [REDACTED] and Test Surface Water WSW should be prioritised more urgently to help minimise abstraction on the Test and Itchen all the time, not only in a drought (Annex 20, page 32).</p> <p>24 No work is taking place to ensure the alternative Hampshire effluent recycling option using [REDACTED] and a bespoke environmental buffer lake are advanced as a back-up, despite this work having been allocated funding by Ofwat. Nor is there any reference to further investigation of a combined Portswood and [REDACTED] scheme. A scheme previously indicated to be feasible with sites that are closer to where the water is needed. (For more detail refer to item J below.)</p> <p>25 Negotiations with a very large industrial water user in South Hampshire should have been brought forward as a priority, to explore alternative supply options when the contract expires in 2026, to free up drinking water for SW customers in a drought (Annex 20, page 6) and provide more certainty for the plan.</p> | <p>million litres of water a day into the reservoir will allow up to 90 million litres a day to be taken during a drought.</p> <p>16) A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations.</p> <p>17) We have engaged an independent consultant for our environmental assessments who are following the standard methodology for these assessments. The investment model takes into account the outcome of environmental assessments and if two otherwise equivalent options are available, it will select the option with lower environmental impact.</p> <p>18) The Hampshire Water Transfer and Water Recycling Project (HWTWRP) is one of the schemes we need to protect the globally important River Itchen and River Test chalk rivers. The scheme will reduce our reliance on these internationally protected rivers during drought and provide a more reliable and sustainable source of water in the future. The increase in customer bills in the first year is a recognition by Ofwat of the costs of developing this scheme, which will be highest in the first half of AMP8.</p> <p>19, 20) We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish. One of the complications with moving abstractions close to sea is the impact of tides on the duration of abstraction and water quality. We will be exploring them further for our next plan.</p> <p>21) A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>22) Our plan includes two groundwater schemes on the IOW to provided up to 3.4MI/d 2040.</p> <p>23) With regard to prioritisation of recycling water at Itchen WSW, as noted in the rejection register against these schemes, enhancements to treatment process are needed at these sites to reduce process losses. These would be considered for WRMP29.</p> <p>24) We are focussed on delivering the HWTWRP by 2033-34. The alternative option to use Fareham for recycling water has not been shelved but is put on hold.</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|           | <p>Could a desalination plant that trials research into alternative technology, potential uses for the hyper saline solution and reducing energy consumption be a way forward for this site (Annex 20, page 30 refers) perhaps in partnership with industry.</p> <p>26 In West Sussex the need for network upgrades is being used as an excuse not to bring forward schemes at existing works that would increase supply (Annex 20, Appendix A). If all of these schemes rejected for this reason were brought forward, they could deliver more than 20Ml/d of water to the Central Region. This is more water than is to be provided by the proposed Littlehampton (Ford) effluent recycling scheme which will discharge to the Western Rother. The necessary network upgrades in West Sussex should form part of the plan. Network upgrades are taking place in Hampshire to address such concerns, why not in West Sussex?</p> <p>27 Across the Western and Central Area the fact that sources 'might not be available in a drought' is being used by SW as an excuse not to increase capacity at existing water treatment works. If the works were upgraded they could be used at higher capacity during normal operation, leaving other groundwater sources that would be available in a drought to rest or be used less, so that more groundwater is available in a drought. Schemes to increase capacity at existing works could deliver 18 Ml/d of water across the region and these options should be prioritised. However, SW are less likely to find this an attractive option where the source is surface water because it is cheaper to treat and supply groundwater every day. SW need to plan to use their water sources in a more sustainable way that works with climate change, not just use the cheapest sources first.</p> <p>28 Multiple cheaper and more sustainable schemes have been rejected by SW because they 'cannot be delivered in time' (presumably this means by 2030).</p> <p>17 schemes in Hampshire and IOW (Western Area) could deliver at least 42 Ml/d.</p> <p>7 schemes in West Sussex (Central Area) could deliver at least 18 Ml/d</p> <p>Yet the effluent recycling scheme in Hampshire which will supply both Hampshire and West Sussex cannot be delivered until 2035 either, and that timescale will almost certainly slip further. SW are putting all of their 'eggs in one basket'. Surely it is better, more resilient and more sustainable to develop multiple smaller schemes, close to where the water is needed, many of which do not even require new consents, just treatment plant or borehole upgrades.</p> <p>29 SW are still not urgently investigating and bringing forward additional new reservoir schemes in the short to medium term, despite this being customers preferred choice. The delivery of the River Adur project is not scheduled until 2039/40, no other reservoir schemes are in the pipeline in Hampshire or West Sussex in the revised draft plan.</p> <p>30 Groundwater schemes on the Isle of Wight (IOW) are not brought forward as the water gained cannot be transferred to the mainland to help the rivers Test and Itchen in a drought (Annex 20, page 5-6). However, if implemented they would reduce the amount of water that needs to be transferred from Southampton to the IOW providing a benefit that should be pursued.</p> <p>31 The timescale for delivery of ten years should not be seen as a valid reason to reject provision of a bi-directional link between the IOW and the mainland, especially as it could allow water to be used more flexibly in a drought, including use of future spare water from Sandown.</p> <p>32 There has been little proactive work by SW to investigate buying or trading licences with private supply users across the region. In a restricted document supporting the previous draft plan it indicated buying just one licence could deliver 19.7 Ml/d. There should be more</p> | <p>25) We will be exploring the option of amending the bulk supply agreement with a large industrial user in HSW WRZ when the existing contract expires in 2026. However, we are not planning to consider any changes to the bulk supply agreement for WRMP24.</p> <p>26) Network enhancements in the Central area were not taken forward as the required enhancements could not be delivered by 2030. These will be reconsidered for WRMP29.</p> <p>27) The amount of water we can abstract from river and groundwater sources are determined by our abstraction licences, which typically specify the maximum amount of water we can take from a source over a year with a limit set on maximum daily abstraction. We cannot take unlimited amount of water from these sources during wet periods.</p> <p>28) Notwithstanding the fact that these 17 schemes are not explicitly identified in this query, there is little benefit in developing 17 schemes by the 2030s when the three schemes we are progressing will deliver the over twice the volume over a similar timeframe. We did not simply reject schemes because they could not be delivered by 2035. Only the schemes that were considered to mitigate the use of drought permits and orders beyond 2030 had to meet the criterion of being deliverable by 2030, because schemes delivered after 2030 would not be able to mitigate the reliance on drought permits and orders beyond 2030.</p> <p>29) We have looked at over 50 reservoir options as part of our options appraisal process over the last 3 WRMP cycles. These are not taken forward due to environmental concerns that will make it difficult to get planning permission. However, we review these options for each WRMP cycle and will review them again for WRMP29.</p> <p>30) Our plan includes two groundwater schemes on the IOW to provided up to 3.4Ml/d 2040.</p> <p>31) The delivery time of an option is the reason for rejection only in cases where water is needed earlier than the option can be delivered. The delivery time in itself is not a reason for rejecting an option.</p> <p>32) We are open to licence trading. The Sittingbourne industrial re-use scheme in our Kent area is effectively a licence trading scheme that will provide up to 8Ml/d from 2030-31 onward.</p> <p>33) Our water efficiency plan includes helping non-household customers reduce their consumption through smart metering and water audits as well as a collaborative fund to promote water efficiency.</p> <p>34) Regarding water butts, following the success of the pilot scheme, this is now being replicated in Kent, where we are installing more than a thousand free water butts to help reduce storm overflows in Whitstable, Deal, Swalecliffe, Margate and in Fairlight, East Sussex.</p> <p>35) Noted</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>proactive investigation and negotiation by SW to buy existing private abstraction licences, this in turn would then open up the potential for a more flexible approach to the use of licences within a catchment to meet water supply needs and environmental objectives.</p> <p>33 Much more effort needs to be put into working with industry, agriculture, golf courses and community buildings (schools, social clubs and so on) to fix leaks, save water and reduce their use of drinking water for non-potable uses. Southern Water pilots have already demonstrated that great reductions can be achieved with free surveys and provision of grants to encourage the adoption of more sustainable solutions. Yet their targets for improvement in the first 10 years of the plan are woeful, with no benefit by 2030, and hardly any by 2035.</p> <p>34 The free water butt scheme trialled on the IOW should be rolled out across the SW supply area to customers as a priority.</p> <p>35 To read about a strategy for a better way forward please refer to the Water Matters page on 'A better way forward' at this link.</p> <p>36 Critical documents to understanding and evaluating the options available have not been made available to the public. Instead, SW have classified the Options Appraisal and key environmental assessment reports as restricted. In fact there are more documents restricted in 2024, than there were in 2022. Is this a deliberate play to hide important information? As SW know it is unlikely that customers will be prepared to travel to their Worthing HQ to view these large reports that cannot be properly reviewed in one visit. Other water companies made this information more accessible.</p> <p>37 Customer research across the water industry has shown a clear preference for more natural solutions such as aquifer storage, reservoirs and catchment management. Why are SW not listening to their customers and instead pushing ahead with the least favoured options of desalination and effluent recycling?</p> <p>38 Assurances given by SW that water quality modelling and energy use information for the Hampshire effluent recycling scheme would be available in time for the 2024 consultation have not been met.</p> | <p>36) Regarding transparency, our Statement of Exclusion published on our consultation web page (see below) detailed those documents that were not published online due to material being commercially sensitive, or restricted under section 37(B) of the Water Industry Act 1991, or 'the Act' (as amended by the Water Act 2003). We are required to make sure that all published documents comply with the Security and Emergency Measures Direction (SEMD). Restricted documents/ sections are available for view via appointment in our head office in Worthing. For the fdWRMP24 we are making as many of the documents available on our website as possible although some information has been redacted so as to comply with SEMD and, in line with guidance, we do not publish any material of a commercially confidential nature.</p> <p>The information provided in many of the documents is very technical with many requirements set out in statutory process and supporting guidance. As this is unavoidable we produced a non-technical summary document for those seeking a high level understanding of our plan. You can view the publicly available documents on the link below.</p> <p><a href="https://waterresources.southernwater.co.uk/find-out-more/">https://waterresources.southernwater.co.uk/find-out-more/</a></p> <p>37) We consulted extensively with our customers and stakeholder before publishing our dWRMP24 and solicited their views on the different option types. However, we have a statutory duty to maintain uninterrupted supply of water in all but the most extreme weather conditions, which may mean selecting options less preferred by customers.</p> <p>38) The water quality modelling and assessments undertaken so far have shown that there are unlikely to be any ecological or biodiversity impacts in the Solent from the water recycling process. Water quality in the reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025.</p> <p>We made clear in our Summer 2024 Consultation for the Hampshire Water Transfer and Water Recycling Project that water quality modelling and assessment work was ongoing and would be fully reported in our Development Consent Order application. As that work has progressed, we are now consulting on it as part of our Spring 2025 Consultation.</p> <p>As part of our Summer 2024 Consultation, we shared our preliminary assessment of carbon emissions associated with the Hampshire Water Transfer and Water Recycling Project. This was based, in part, on energy usage information for the project. An updated carbon emissions assessment will be provided as part of our Development Consent Order application. The energy usage information used to support that will be appended to the assessment.</p> <p>39) Our consultation engagement with our customers and stakeholders is described in Annex 5 of our rdWRMP24 Technical Report.</p> |

|           | <p>39 Lack of adequate and meaningful engagement /consultation with customers;</p> <ul style="list-style-type: none"> <li>– A very significant alteration is taking place to customer's water supply with the source changing from river, spring or groundwater to recycled effluent. SW should be proactively engaging with all their customers to get their feedback on this material change.</li> <li>– SW did not follow the legal requirement for a new statutory consultation on their plan when there was a material change to the option(s) selected in 2021, when the [REDACTED] desalination scheme was rejected, and the WRMP19 back-up option of discharging recycled effluent to the River Itchen was also rejected. When there was a material change to the plan in 2021 SW should have undertaken a comprehensive review of all the available options and a full public consultation. This did not happen.</li> </ul> <p>As a result, communities in the areas affected by the selected options did not have the opportunity to comment at the 'formative stage' of the plan, before the new effluent recycling options were selected.</p> <p>At the time of previous consultations (2020 to 2022) posters were not even placed at sites impacted to make local communities aware that a consultation was taking place. Nor have posters been placed at impacted sites for this Autumn 2024 consultation.</p> | <p>In addition to publishing the majority of our rdWRMP24 documents on our website, we arranged 8 roadshows across our supply area during October-November; 3 in our Western area, 2 in our Central area and 3 in our Eastern area. Southern Water staff were available at these roadshows to answer any questions on our rdWRMP24. Hard copies of our rdWRMP24 Technical Report and Non-Technical Summary of our plan were also available for attendees to view and take with them. In addition, we provided 5 area-specific webinars of 75 minutes duration each whereby we presented key features of our plan during the first 35-40 minutes with the remaining time allocated to Q&amp;A.</p> <p>We released a press release regarding the consultation, which was picked up by major newspapers; The Guardian and the Financial Times. We produced both targeted and non-targeted adverts on social media. We also publicised the consultation in our newsletter which went out to all of our customers. MPs, Stakeholders and previous responders were all directly emailed regarding the consultation.</p> <p>With regard to the requirement for a full statutory consultation following the removal of the West Southampton Coast desalination option, the deselection of West Southampton Coast desalination was taken at Gate 1 of the RAPID process (outside of WRMP) in September 2021. Southern Water was then instructed by the Secretary of State to submit a draft WRMP in June 2022 (compared to October 2022 for other water companies), beginning in 2023 and covering 27 rather than 25 years. We consulted on our draft Water Resource Management Plan 2024 (dWRMP24) in 2022-2023 and, following changes, we consulted on our revised draft WRMP24 in 2024.</p> <p>For more information, see here:<br/> <a href="https://www.ofwat.gov.uk/regulated-companies/rapid/the-rapid-gated-process/accelerated-gate-two-submissions-and-new-solution-proposals/">https://www.ofwat.gov.uk/regulated-companies/rapid/the-rapid-gated-process/accelerated-gate-two-submissions-and-new-solution-proposals/</a></p> |
|           | <p>40 The consultation documents are vast, very repetitive and fail to provide important information, or make it restricted and inaccessible, making it very difficult for a lay person to understand/get through the consultation reports. Is this intentional?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>40) We provided detailed information on our rdWRMP24 through a technical report accompanied by 22 annexes. The WMRP, by its nature, is a highly technical plan. We need to demonstrate that our plan is legally and technically compliant with the regulatory framework and that makes the use of technical terms unavoidable. However, we do try to make the plan understandable to a broad audience and therefore included a detailed glossary at the start of our rdWRMP24 main technical report. In addition, we also published a non-technical summary that highlighted key features of our plan.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| WRMP1040  | <p>Southern Water's Water Recycling System Proposal</p> <p>This proposal is flawed on so many levels that it is surprising that it has gone this far.</p> <p>Many others have criticised the details so very well that it does not need repeating.</p> <p>The problem is that it is a proposal:</p> <ul style="list-style-type: none"> <li>· made by a privatised industry for its financial benefit.</li> <li>· It extends its monopoly power and reduces public accountability</li> <li>· It is effectually a means of a private body taxing its captive customers without limit</li> <li>· It seeks to take its monopoly over its raw materials -sewage – as the best, and only raw material for providing fresh water for human consumption in emergencies.</li> </ul> <p>Southern Water should not extend their monopoly over the decision-making process.</p> <p>DEFRA not the water industry and its lobbyists should be driving this project independently of these interested parties.</p> <p>There are multiple preferable alternatives ranging from:</p> <ul style="list-style-type: none"> <li>o Building additional reservoirs</li> <li>o Separating the fresh water at source from raw sewage instead of combining them.</li> <li>o Building a new fresh water harvesting system (which would relieve the Water Companies of the peak loads which they cannot currently deal helping them to discharge their present statutory duties.)</li> <li>o Capture the freshwater from streams just before their waters are polluted with seawater just before they enter the sea.</li> </ul> <p>Southern Water have a conflict of interest in seeking to monopolise the debate.</p> <p>Government should propel this debate – not rely on interested 3rd parties.</p> <p>The Water Industry is mired in its own failures and practices. It is the last organisation to be allowed to dictate policy</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>The WRMP process is set out in primary legislation, within Defra directions and in guidance issued by the Environment Agency (EA), Natural England, Ofwat and Natural Resources Wales. We, Southern Water, have produced this WRMP24 in line with Directions and guidance issued by Defra and our regulators. We will continue to do so.</p> <p>Our plan has been produced in collaboration with other water companies within the South East as part of the Water Resources South East (WRSE) regional group. We provide annual reviews of our WRMP to regulators and produce an entirely new WRMP every five years. This process allows for changes to be made to the WRMP to account for new information and consultation feedback. In rare cases, for example, where there are unresolved issues and substantial public interest exists the Secretary of State may call an inquiry or hearing.</p> <p>In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history. It should be noted that Southern Water has temporarily suspended dividends to shareholders and has not paid dividends since 2017. Also, the £1.6 Billion investment funding received from Macquarie Asset Management has been paid to Southern Water Group and none of this amount has been paid to previous shareholders.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>We are planning to build two reservoirs; the Havant Thicket Reservoir with Portsmouth Water and SESRO together with Thames Water and Affinity Water. Our plan also includes provision for building another one in Sussex. We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. Reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| WRMP1041  | <p>I object to Southern Water's scheme to use recycled sewage effluent from [REDACTED] to top up our water supply and build a treatment plant at Broadmarsh.</p> <p>The scheme that Southern Water proposes is:</p> <ul style="list-style-type: none"> <li>costly to implement (£1.2 billion outlay for a life expectancy of c60 years),</li> <li>costly to run (estimated to be c£3M pa for Hampshire alone),</li> <li>detrimental to the environment (effluent recycling via Havant will have an unacceptably high carbon and greenhouse gas emissions impact)</li> <li>detrimental in impact on the fresh water environment and the marine environment (significant additional risk of pollution - particularly in Langstone harbour - with, currently, no plans for independent monitoring of the recycling plant discharge)</li> </ul> <p>Southern Water should be made to:</p> <ul style="list-style-type: none"> <li>properly explore more cost-effective alternative solutions</li> <li>take heed of the impact of climate change</li> <li>consider the financial benefits of collecting and storing rainwater</li> <li>put eco systems and the environment before profit</li> <li>commit to a much needed upgrade and repair to the infrastructure</li> <li>be transparent about their plans and allow sufficient time and a proper forum for public consultation</li> </ul> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>Your objection to the use of recycled water in Havant Thicket has been noted.</p> <ul style="list-style-type: none"> <li>We appreciate that the capital cost, operating cost and energy consumption of our Hampshire effluent recycling scheme is higher than conventional sources of supply such as groundwater or rivers. However, those conventional sources are no longer available to us as they once were. When we carry out our options appraisal process, we must consider other factors alongside cost such as an options resilience to climate change, the volume of water it can provide, its environmental impact etc. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</li> <li>Please see answer above.</li> <li>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</li> </ul> <p>As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible.</p> |

|           |          | <p>We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <ul style="list-style-type: none"> <li>• Water recycling is widely used around the world to create a new source of supply that means less water needs to be taken from the environment supporting wildlife, particularly in a drought. A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and any potential mitigations. The Environment Agency will determine the permit for the release of purified recycled water into Havant Thicket reservoir. They monitor and ensure compliance for all discharges to the environment.</li> <li>• Southern Water has undertaken an extensive options appraisal that looked at more than 1,000 options with WRSE.</li> <li>• Please see answer above relating to climate change being a key consideration when appraising options.</li> <li>• We have considered a number of storage options in the past and will reassess them for WRMP29. This includes considering locations for new reservoirs. Reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage).</li> <li>• Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</li> <li>• In its business plan for the next five-year regulatory period, due to start in April 2025, Southern Water has proposed another step-change in investment amounting to approximately £8 billion of expenditure. This would be equivalent to investing circa £3,500 per household and would be the largest investment programme in the Company's history.</li> </ul> <p>Regarding transparency, our Statement of Exclusion published on our consultation web page (see below) detailed those documents that were not published online due to material being</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>commercially sensitive, or restricted under section 37(B) of the Water Industry Act 1991, or 'the Act' (as amended by the Water Act 2003). We are required to make sure that all published documents comply with the Security and Emergency Measures Direction (SEMD). Restricted documents/ sections are available for view via appointment in our head office in Worthing. For the fdWRMP24 we are making as many of the documents available on our website as possible although some information has been redacted so as to comply with SEMD and, in line with guidance, we do not publish any material of a commercially confidential nature.</p> <p>The information provided in many of the documents is very technical with many requirements set out in statutory process and supporting guidance. As this is unavoidable we produced a non-technical summary document for those seeking a high level understanding of our plan. You can view the publicly available documents on the link below <a href="https://waterresources.southernwater.co.uk/find-out-more/">"https://waterresources.southernwater.co.uk/find-out-more/"</a></p> |
| WRMP1042  | <p>I am writing to let you know that I don't think it's a good idea for the planned recycling scheme (concerning the Havant Hants area).</p> <p>I've read the 5 major points against the idea &amp; my objection is overall that I don't think it's a good idea to send treated sewage back into our main drinking water supply, when we got some the best &amp; cleanest - healthiest water in the country coming down off the Portsdown &amp; Southdown hills - why ruin it?</p> <p>Also, if something in the recycling system fails &amp; raw sewage gets into the drinking water (like it has done with the sewage in langstone harbour scandle) then it will be like going back to the 1600 - 1700's when people took drinking water out the Thames in London &amp; wondered why they were getting ill &amp; dying - it could be complete genocide with thousands dying from E coli etc</p> <p>The water system is working so far (apart from the sewage spills into Lanstone harbour but thats a separate issue) so why alter it?</p>                                                                                                  | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We note the objection to the use of recycled water in Havant Thicket. The plant will monitor the quality of the treated effluent from Portsmouth Harbour WTW and will shut down if this moves outside of the treatable parameters. The recycled water will also have a lower nitrate level than the spring waters, due to the treatment at Portsmouth Harbour WTW.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| WRMP1043  | <p>I wish to comment on Southern Water's Draft Water Resources Management Plan and request that you reject it.</p> <p>I am concerned about the proposals for using wastewater recycling based on the effluent from the [REDACTED] Waste Water Treatment Plant at Havant.</p> <p>The wastewater recycling processes that are proposed (microfiltration, reverse osmosis and UV treatment with hydrogen peroxide) are largely unproven for the provision of drinking water in this country and I object to being used as a guinea pig for Southern Water's proposals. I have no confidence in their ability to operate such a system safely.</p> <p>Southern Water should reconsider using the Havant Thicket Reservoir as an environmental buffer for this project. That usage risks irreversibly contaminating the reservoir. Also, it risks interfering with the planned seasonal fluctuations in the water level, in turn reducing the biodiversity gains that are planned for the reservoir.</p> <p>The Broadmarsh area proposed for the wastewater treatment equipment is a most unsuitable site, situated on a former rubbish dump.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We note you concerns about the use of recycled water in Havant Thicket. The HWTWRP scheme uses global best practice with a multi-barrier approach and monitoring to ensure that the water quality is exceptional when transferred to Havant Thicket reservoir.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">customers: https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p>                                                                                                                                             |

| Reference | Feedback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|           | <p>I am appalled by the energy implications of running the treatment process continuously so that the equipment stays in good operating order. The energy requirements for pumping at least 30ML per day of the treated water over a distance of more than 40 km to [REDACTED] are huge and unnecessary. Alternative schemes must be possible that would be closer to the areas that require drinking water. Such alternatives that should be investigated include the construction of smaller winter storage reservoirs, increased use of aquifer storage and moving the existing water abstraction points closer to the tidal limit of the Rivers Test and Itchen.</p> <p>I consider that all new housing to be built in the area should be to a higher specification of water conservation, such as by the provision of showers but not baths. Greater attention should be given by Southern Water to the elimination of leakage from their supply network.</p> <p>Kind regards,</p> | <p>Work formally paused on investigating and developing Fareham Wastewater Treatment Works as a back-up option in May 2023, in agreement with RAPID, and so we have not developed it to the same level as HWTWRP. A Back Up option was also identified. This involved transfer of recycled water from a water recycling plant to Itchen WSW via an environmental buffer. Desalination options were removed from further consideration at this stage. The outcome of the options appraisal process was supported by RAPID at Gate 2. Although both HWTWRP and the Back Up option were able to meet requirements of supplying 75ML/d in the Western Area (as required by WRMP19), and were able to meet the identified future need of up to 90ML/d, HWTWRP presented significantly better value for customers and was better able to meet long-term regional supply requirements due to improved adaptability. Therefore, the focus was on progressing HWTWRP as the selected option.</p> <p>With regard to effects of recycled water on biodiversity, purified recycled water is extremely clean. Water quality in Havant Thicket reservoir and in the reject water released to the sea is the subject of our ongoing Environmental Impact Assessment – which will be published as part of our planning application, which we expect to submit later in 2025.</p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased “Site 72”, an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response.</p> <p>Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Water from the water recycling plant will be used all year round to supply Southern Water customers, following further environmental restrictions including abstraction limitations from Natural England’s Common Standards Monitoring Guidance conditions. These conditions set new year-round flow targets for the River Itchen and proposed targets for future implementation on the River Test, reducing the water available, both in the summer and winter. The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water.</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This was not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish. A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We are planning to build two reservoirs; the Havant Thicket Reservoir with Portsmouth Water and SESRO together with Thames Water and Affinity Water. Our plan also includes provision for building another one in Sussex. We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. Reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> |
| WRMP1044  | <p>I hope you are listening to consumers' concerns. I am particularly concerned about the proposal to allow Souther Water to treat sewage effluent to produce our drinking water. Having experienced their woeful lack of success in treating the waste water that flows into Chichester Harbour, which is now catastrophically polluted and is killing wildlife and harming residents, I have zero confidence that Southern Water is competent to treat waste water well enough to produce drinking water.</p> <p>The process is complex and there are many stages when human error or negligence could cause it to break down.</p> <p>We are currently in a declining/failing situation as far as retaining our SSSI status. We have massive erosion of sea grass and salt marsh, because of sewage and farming pollution. Our statistics for chemical and biological pollution (as proven by our recent citizen science project) are abhorrent. All of this is caused by Southern Water failing to treat effluent well enough to discharge into the harbour at a level that is safe for wildlife and recreational use. How on earth do you think that the same organisation is capable of treating effluent well enough to provide drinking water?</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We note the objection to the use of recycled water in Havant Thicket. We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers:</p> <p><a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> <p>The HWTWRP scheme uses global best practice with a multi-barrier approach and monitoring to ensure that the water quality is exceptional when transferred to Havant Thicket reservoir.</p> <p>Our Water Resources Management Plan covers our plan for provision of drinking water. Our treatment processes are designed to treat the water quality found in the water sources we rely</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| WRMP1046  | <p>I write to object strongly to the proposals by Southern Water to build and operate an Effluent Recycling plant and operation.</p> <p>I have read and noted the points set out in the two documents prepared by Havant Matters - <a href="https://havantmatters.org/water/key-concerns/">https://havantmatters.org/water/key-concerns/</a> and <a href="https://havantmatters.org/water/wrmp2024/">https://havantmatters.org/water/wrmp2024/</a></p> <p>These two documents overwhelmingly show that this is an inappropriate scheme, badly planned. Our environment needs us to take steps that are designed for the future, not a scheme that is there to generate profits for the company and its shareholders, but which have a significant impact on the local neighbourhood, environment and people.</p> <p>I am sure that you have received many emails citing the arguments in these documents, and will be aware of the contents. I would simply say that I agree with most of the points made, and feel that we need the company to be brought to heel and required to reconsider these plans taking far more account of the people, neighbourhood and environment.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback. Your objection to the use of recycled water in Havant Thicket has been noted.</p> <p>We note your reference to the documents prepared by Havant Matters. The response to which can be found in Annex 4 of this statement of response.</p> <p>Our Water Resources Management Plan follows the framework provided by our regulators, which emphasises the need to not only secure a water supply but to benefit wider society and the environment. This means that we need to leave more water in the environment which requires us to innovate and consider water supply and storage options that have not been traditionally used, such as wastewater recycling in order to meet future demand.</p> <p>We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply for future generations means that all viable schemes need to be considered. The potential drawbacks of all options are considered in view of the proposed benefit it delivers.</p> <p>Our website will contain the development of our WRMP24 and, going forward, our WRMP29.</p> |
| WRMP1047  | <p>I am writing to object in the strongest possible terms to Southern Water's revised draft Water Resources Management Plan for the following reasons: -</p> <p>It is inconceivable to me that Southern Water (SW) should consider mixing recycled effluent with the chalk spring supplying the Havant Thicket reservoir. Why should customers be forced to: -</p> <ul style="list-style-type: none"> <li>· Drink this product?</li> <li>· Pay the additional costs of building a complex high-risk system and the costs to run it?</li> </ul> <p>This project is supposed to be a drought resource which would only be needed in times of extreme water shortage. However, to maintain readiness for an emergency the pipes and filter membranes will have to operate continuously every day at the optimal operating condition. To do this SW will need to process and pump around it's system a volume equivalent of 12 Olympic size pools of water a day. It is understood the energy cost alone would be £3 million pounds per year in a normal year (i.e. not in a drought).</p>                                                                                              | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>We consider all options as part of our options appraisal process. The scheme ultimately selected in the plan represents, in our view, the overall best value for the customers and the environment in terms to being able to meet the anticipated demand, resilience to climate change and delivering Environmental Destination.</p> <ul style="list-style-type: none"> <li>- The taste would also vary if recycled water is added, but the water at customers' taps will continue to meet strict drinking water quality standards and be wholesome to drink. We are working closely with international experts, regulators and environmental organisations to develop the plans and ensure this.</li> <li>- The way that the water sector is operated and regulated in England and Wales means that the costs for all schemes are ultimately recovered through customer bills over a period of time. This is true for the HWTWRP as well.</li> </ul>                                                                                                                                                                                         |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|           | <p>Despite the complexity of the new treatment process, which is new to the UK, and the risks to the reservoir if SW fail to maintain the treatment plant, no independent monitoring is proposed.</p> <p>Money invested in effluent recycling becomes redundant when the plant comes to the end of its life in in approximately 60 years time. Upgrades and replacement of electrical &amp; mechanical plant are needed every 10 to 20 years. Whereas a winter water storage solution, such as a reservoir, works with climate change and will still be in there in 200 years time. A reservoir solution also provides better value for money and more environmental benefits, as well as potential benefits to reduce winter flooding.</p> <p>I have concerns about the impact of more concentrated reject water from the effluent recycling process being discharged in to the Solent via the existing Eastney Long Sea Outfall. The SW assessment indicates a 'likely significant effect' in their Preliminary Environmental Information Report published with the consultation.</p> <p>Also I am concerned at the significant risk of leachate and landfill gas being mobilised by piling and tunnelling, required to build the recycling plant, through the waste into the chalk aquifer below – groundwater flow in the aquifer is to the south (i.e. flowing towards Langstone Harbour).</p> <p>It is a retrograde step to drive people away from tap water to bottled water. In California and Singapore water recycling is used and many people have changed to using bottled water.</p> <p>SW lose 100 million litres of water every day to leaks, that is 19% of all the water they abstract from the environment, which customers pay to treat, wasted through leakage in their distribution system. Their slow programme for improvements means even by 2050 they will still be leaking about 10% of all the water they treat, including the new water manufactured at huge cost from their planned new effluent recycling scheme.</p> <p>The company is allowed to make a profit from building the new infrastructure. There is real concern that rejection and selection of water resource options is being driven by the search for profit, as the current funding mechanism incentivises water companies to develop infrastructure heavy solutions like effluent recycling, which allow them to make more profit, rather than developing more sustainable solutions.</p> <p>SW should actively investigate more viable alternative solutions. England receives plentiful rainfall and SW should consider storing this in additional reservoirs which would cost less to build, less to maintain, uses low risk technology and have a lifetime of hundreds of years.</p> <p>This proposal by SW is indicative of a company driven by profit with no regard to how it treats its' customers, the environment, or future generations. Further, SW's ability to plan a viable maintenance schedule going forwards needs to be looked at by government and changed ASAP. UK utility companies should not be able to hold the government to ransom by threatening bankruptcy if their working practices are challenged in any way.</p> | <p>Water from the water recycling plant will be used all year round to supply Southern Water customers, following further environmental restrictions including abstraction limitations from Natural England's Common Standards Monitoring Guidance conditions. These conditions set new year-round flow targets for the River Itchen and proposed targets for future implementation on the River Test, reducing the water available, both in the summer and winter. Water recycling inevitably uses more energy and is subsequently more expensive to operate than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>The HWTWRP scheme uses global best practice with a multi-barrier approach and monitoring to ensure that the water quality is exceptional when transferred to Havant Thicket reservoir. The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water. The water recycling plant will monitor the quality of the treated effluent from Portsmouth Harbour WTW and will shut down if this moves outside of the treatable parameters. The Environment Agency will determine the permits for the release of purified recycled water into Havant Thicket reservoir and will monitor them. The Environment Agency ensure compliance of all discharges.</p> <p>A Water Recycling Plant would be typically expected to last 60 plus years but have a number of upgrades every 10-20 years of the electrical and mechanical plant.</p> <p>We are planning to build two reservoirs; the Havant Thicket Reservoir with Portsmouth Water and SESRO together with Thames Water and Affinity Water. Our plan also includes provision for building another one in Sussex. We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs. Reservoirs require a unique set of geological, geomorphological and hydrological settings to be viable. A Chalk Managed Aquifer Recharge (MAR) scheme (feasibility trial) is considered for South Hampshire. Lower Greensand Aquifer Storage and Recovery (ASR) schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> <p>We note your concerns about the reject water and A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations.</p> <p>Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response.</p> <p>Customer insight locally and nationally shows broad support for water recycling. We don't expect customers to buy bottled water when the clean, wholesome water coming from their taps continues to meet strict UK water standards and is many hundreds of times cheaper.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>The investment model needs to objectively select options based on standardised input criteria. It cannot be configured to preferentially select either smaller or larger options as that will lead to biased results and it cannot be demonstrated that the preferred plan is either least cost or best value. It does select drought options in preference to large infrastructure schemes and that is because drought options typically do not have large CAPEX expenditure. This is explained in further detail in Annex 20 of our rdWRMP24 (section 6).</p> <p>Ofwat regulates the amount of money that water companies can charge the general public for their services through their Price Review, with the most recent being completed on 19th December 2024 (PR24). The Price Review is based on water company business plans for the next 5 years, which are informed through the Best Value Plan outlined in the Water Resource Management Plan. Ofwat also regulate the amount of profit that water companies can make, which for the next 5 years cannot exceed 4.03%. This is the maximum profit a water company can make and various Price Control Deliverables set by Ofwat ensure that water company poor performance is reflected in a reduced profit margin and fines.</p> <p>We have dedicated budget for both proactive and reactive maintenance work and the budget is periodically reviewed to prioritise key maintenance activities.</p> |
| WRMP1048  | <p>We would like to object to Southern Water's water management plan for the following reasons:</p> <p>Southern Water should first address the mind-blowing wastage of water through leaks. Customers are currently paying for SW to lose 20% of the water that they collect.</p> <p>This is a very expensive project, cheaper, greener and more sustainable alternatives have been discounted or not properly investigated. It would seem that it is because they may not make as much profit for the company. There needs to be consultation on the whole range of options for water security.</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. | Reference | Feedback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>This is a top-heavy, over-engineered and energy-intensive project designed to make maximum profit for Southern Water rather than making best use of natural water. Not only are the costs huge, but the project, with a 24/7, 365 days a year pumping requirement, does nothing towards a sustainable energy future.</p> <p>Southern Water do not have a good reputation in terms of water management. Their constant dumping of sewage into our harbours has angered most people so their ability to manage a project like this with no accidental contamination could be highly questioned. Many people will turn to bottled water rather than use this type of tap water, creating even more plastic waste.</p> <p>This scheme does nothing about the problem of sewage discharges into our harbours – indeed, by building the water recycling plant on land that is an historic landfill, we further increase the problem of environmental damage from our water industry. Rejected water from the water recycling plant is even more contaminating than the sewage already regularly dumped in the harbours.</p> <p>We are supposed to be searching for ways of reducing our carbon footprint and address climate change and this project does neither, better ways could be used to overcome our water supply issues whilst addressing both these issues.</p> <p>Another possible solution that is not adequately considered is to move river abstractions to the tidal limit on the rivers Itchen and [REDACTED]. This has the effect of protecting the freshwater sections of the rivers and restoring natural flows. This is much simpler, and an added benefit is that because it is much closer to water treatment works and so requires fewer kilometres of pipeline.</p> <p>We are not a drought-ridden country. Recent flooding in many parts indicate this. Our challenge is to capture and store winter water for use in dry summers. The building of reservoirs and confined aquifers would do this, as well as help to alleviate flooding in at risk areas.</p> | <p>With regard to the potential to develop small sustainable schemes, we have to meet very challenging demand management and Environmental Destination targets set by the Government. The resulting scale of supply-demand balance deficits requires us to be ambitious as well as innovative to meet future challenges. Environmental sustainability is a key criterion for including options in our plan, regardless of the size of the option.</p> <p>Water from the water recycling plant will be used all year round to supply Southern Water customers, following further environmental restrictions including abstraction limitations from Natural England's Common Standards Monitoring Guidance conditions. These conditions set new year-round flow targets for the River Itchen and proposed targets for future implementation on the River Test, reducing the water available, both in the summer and winter.</p> <p>Water recycling inevitably uses more energy than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were. As WRMP24 options are constructed, our baseline emissions will evolve. This may increase our total emissions as infrastructure projects with higher carbon costs, such as water recycling plants, are introduced. We will need to continuously adapt our solutions to reach and maintain operational Net Zero, while driving down embodied emissions through our supply chains as much as possible. We are firmly committed to reducing the greenhouse gas emissions released through delivery of our essential water and wastewater services. Our Net Zero Plan outlines the actions we are taking to reduce our carbon footprint, while also supporting the realisation of wider, long-term decarbonisation commitments, including the UK Government's legislative target to reach Net Zero by 2050. The actions set out in our Net Zero Plan will be key to mitigating the greenhouse gas emissions associated with the options we have proposed in our WRMP24 strategy.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers: <a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a>. Customer insight locally and nationally shows broad support for water recycling. We don't expect customers to buy bottled water when the clean, wholesome water coming from their taps continues to meet strict UK water standards and is many hundreds of times cheaper. Water recycling is widely used around the world to create a new source of supply that means less water needs to be taken from the environment supporting wildlife, particularly in a drought.</p> <p>Our Water Resources Management Plan covers our plan for provision of drinking water. Our treatment processes are designed to treat the water quality found in the water sources we rely</p> |

|           |                                                                                                                                                                                                                                  | <p>upon. For further information on sewage treatment please refer to our Drainage and Wastewater Management Plan which you can find here: <a href="https://www.southernwater.co.uk/about-us/our-plans/drainage-and-wastewater-management-plans/">https://www.southernwater.co.uk/about-us/our-plans/drainage-and-wastewater-management-plans/</a>. A further consultation on water quality was held in March-April 2025. This included details of the likely impacts on water quality in Havant Thicket reservoir and the Solent and potential mitigations.</p> <p>Regarding possible operational issues, the plant will monitor the quality of the treated effluent from Portsmouth Harbour WTW and will shut down if this moves outside of the treatable parameters. The recycled water will also have a lower nitrate level than the spring waters, due to the treatment at Portsmouth Harbour WTW.</p> <p>Concerning the carbon impact of large infrastructure schemes, through the Water Industry National Environment Programme (WINEP), investigations are carried out to determine the sustainability of water company abstractions. Following these investigations the Environment Agency will change licences where necessary to achieve sustainable abstraction. As a result, in some areas, water companies need to look for alternative sources of supply. In some cases, this will necessitate investment in new large-scale infrastructure schemes which, whilst having a benefit to long term security of water supply and the protection of freshwater ecology and habitats, could have an increased carbon impact.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This not viable because of the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>Our supply area is classed as being under 'serious water stress' by the Environment Agency. Please see <a href="#">here</a>. We are planning to build new reservoirs where feasible. This includes the Havant Thicket Reservoir, the South East Strategic Reservoir Option (SESRO) and the River Adur Offline Storage. However, these will be insufficient to provide the volume of water to meet supply-demand balance in future. The HWTWRP is needed to provide the additional volume needed to maintain supply-demand balance and also offers greater resilience in the event of a prolonged drought. We will continue to explore options for additional reservoirs across our supply area for our next plan. A Chalk MAR scheme (feasibility trial) is included in our plan for South Hampshire. Lower Greensand ASR schemes are more challenging to manage and operate for water quality reasons, and they tend to have much shorter asset lives. Though we will be continuing to revisit and review the potential wider use of both MAR and ASR again, within future resource planning.</p> |
| WRMP1049  | I am strongly opposed to the proposals in Southern Water's plans for the next five years. They are both expensive and carbon intensive and do not offer the kind of protection we would expect to see for our local environment. | <p>Thank you for reviewing our rdWRMP24 and providing feedback.</p> <p>The National Framework, Water Resource Planning Guideline and other supplemental policies all recognise the need for water resource plans to not only secure a water supply but</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Reference | Feedback                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|           | <p>We are faced with a range of issues which need addressing: pollution in our rivers and harbours, dealing with storm surges, flood risks, leaking pipes, over extraction from our precious chalk streams and over consumption of water generally.</p> <p>These require an overall plan which is based on sustainability and protection of the environment. We do not need expensive solutions like water recycling; there are plenty of other options which work with nature and do not threaten our local waterways and harbours.</p> <p>Southern Water made a material change in their plans from desalination to effluent recycling since the last plan was issued but they did not carry out a full review or undertake a statutory consultation. This, together with limited consultation, is really unacceptable. I would like to see a plan which deals with all the related issues, restores life to our rivers, ensures a secure future for marine life in our harbours and promises us safe drinking water.</p> <p>At the moment, our water is wasted both by leaking pipes and failure to store winter rain. It is also wasted because people are not encouraged to save water. Smart meters and better use of grey water would both prevent the need for expensive solutions like the plans for water recycling.</p> <p>I recognise that there may be times when water is in short supply but climate scientists predict heavy winter rainfall so I really believe that a better option is storing rain which is being wasted at present. Also, Havant Thicket Reservoir is designed to cope with a one in 200 year drought. Surely we can supplement this?</p> <p>I am also concerned that Southern Water is over estimating its projection of population growth and these figures need careful monitoring.</p> <p>At the moment, we only collect about 1% of the rain which falls in the UK and this could be stored in ways that would prevent flooding. Also, at the moment Southern Water's record on reducing leakage is poor and needs to be much more ambitious. More than 100 million litres of water are lost every day and they should be delivering a much faster program of renewing pipe networks. Having a replacement rate of just one in 1,000 years when the water main is only designed to last a hundred and twenty years is unacceptable.</p> <p>I am particularly opposed to the plans for water recycling at Broadmarsh in Havant for the following reasons.</p> <ol style="list-style-type: none"> <li>1. This is an unnecessarily expensive and carbon intensive project. It would be much cheaper to look at ways of storing winter rainfall. The predicted cost is £1.2b and this money it could be much better spent. We also need a strategy which prioritizes low energy solutions. The energy alone for the Hampshire scheme will cost more than £3 million a year to run and then pipe the water to [REDACTED]. This is surely an unnecessarily expensive drought resource.</li> <li>2. The nature of the reverse osmosis process means that it is required to run continuously. In Havant's case this will produce 30 Mld of water 365 days a year to avoid damage to</li> </ol> | <p>to also add to wider environmental and societal benefit. Our Water Resource Management Plan not only has to look at our water needs for the next 5 years, but needs to look ahead as far as 2075. This means we need to understand changes to our water supply needs and impacts from climate change and population growth. In addition, all water company Water Resource Management Plans now need to leave more water in the environment for the benefit of our plants and wildlife. This means that water companies now need to look at water supply and storage options that have not been traditionally used, such as water recycling and desalination. We understand that some customers may not agree with some of the proposed schemes in our plan, but the challenges we face finding a sustainable water supply into the future means we need to look at all viable schemes and will have to make decisions with the support of our national Government and industry regulators which benefits all society.</p> <p>With regard to the requirement for a full statutory consultation following the removal of the West Southampton Coast desalination option, the deselection of West Southampton Coast desalination was taken at Gate 1 of the RAPID process (outside of WRMP) in September 2021. Southern Water was then instructed by the Secretary of State to submit a draft WRMP in June 2022 (compared to October 2022 for other water companies), beginning in 2023 and covering 27 rather than 25 years. We consulted on our draft Water Resource Management Plan 2024 (dWRMP24) in 2022-2023 and, following changes, we consulted on our revised draft WRMP24 in 2024.</p> <p>We provide non-potable supplies to some large industrial users. However, it is not feasible for us to provide dual supplies, potable and non-potable, to each of our customers. This will also require the entire housing stock across our supply are to undergo modifications in internal plumbing. We do not consider this to be a realistic option. We are working with developers to recycle as much water as possible on new developments at the site level. All our meters going forward will be smart meters. We plan to replace all our existing meters with smart meters by 2030.</p> <p>For dWRMP24 we, together with the other WRSE companies, commissioned Edge Analytics to provide growth forecasts for all companies, in line with government guidelines. Edge Analytics used the latest available local plan data, as well as data from the Office for National Statistics (ONS) and the Greater London Authority (GLA), to produce projections at a WRZ level. Separate forecasts were developed for total population, household population, non-household population, dwellings, dwellings occupancy, population in commercial properties and business counts. Following the publication of latest WRPG in March 2023, we commissioned an update to that forecast (along with other WRSE companies), which enabled us to consider growth under five different projections based on data from Local Authorities, ONS and OxCam. We have not based our plan on a single population forecast but have used a range of population forecasts to determine the nine future supply-demand balance scenarios that we have planned for (see Section 5.5.3 of the rdWRMP24 Technical Report). The estimates of future population growth range is from 7% to 34% growth at the company level between 2025 and 2075. The range of growth forecasts considered each of our WRZs is shown in Section 2 of Annex 7 that accompanied rdWRMP24 Technical Report. As part of our</p> |

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Southern Water Response                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|           | <p>membranes, pipes and pumps. Many people have grave concerns about Southern Water's ability to maintain this without causing pollution.</p> <p>3. This plan will have negative environmental impacts around Langstone harbour, the Solent, Havant Thicket Reservoir and the pipeline route. I am particularly concerned about the waste material from the treatment process being discharged into the sea with its likely concentration of pesticides, pharmaceuticals, forever chemicals and chemical disinfection products.</p> <p>4. It seems that no independent monitoring of the discharge into the reservoir is planned. it's important to realise how little trust local residents have in Southern Water, following years of unnecessary discharges of effluent into the Solent</p> <p>5. We are losing a unique biodiversity opportunity to create a chalk spring fed Reservoir which is of course what people were promised.</p> <p>6. The proposed site at Broadmarsh is on a landfill site full of contaminants and very close to the sea. The plant will require deep piling and tunnelling and so is likely to release toxic leachate into the harbour. (This seems already to be happening) It will also have a significant visual impact on the coast.</p> <p>7. Why has the option of recycling effluent at [REDACTED] been shelved.</p> <p>8. Southern Water seems not to have considered (or put forward to the Environment Agency), alternatives like winter storage. A full review of options should be a matter of urgency. Solutions like small storage areas and moving abstraction from the chalk streams to near the tidal limit could be implemented very rapidly. So could the construction of new reservoirs such as the river Adur offline reservoir in West Sussex</p> <p>9. Not only were alternative schemes not considered but Southern Water unnecessarily withheld 12 volumes from public view so campaigners have been unable to see useful details on options and environmental assessments.</p> <p>10. I am concerned about the cost of the water recycling process and the effect on consumer bills. We are told that the recycling scheme alone will deliver a profit of about £45 million to Southern Water. This not a good way to deal with the range of issues I have listed.</p> <p>11. What about the quality of the water we will be expected to drink? Surely, many people will refuse to drink tap water and we will be presented with even greater problems from plastic bottles.</p> <p>Please reject this plan and ask Southern Water to think again.</p> | <p>adaptive planning approach, we will track population growth and switch to the most appropriate supply-demand balance situation.</p> <p>We have been promoting the use of water butts since we started implementing our universal metering programme back in 2010. This included offering water butts at subsidised rates. We will continue to encourage and promote rainwater harvesting, including financial grants to community level initiatives.</p> <p>Regarding reservoir storage, they require a unique set of geological, geomorphological and hydrological settings to be viable. Our plan includes building two reservoirs (Havant Thicket Reservoir and SESRO) with the possibility of building a third (River Adur Offline Storage). We have considered a number of storage options in the past and will reassess them for WRMP29 in addition to considering locations for new reservoirs.</p> <p>The leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>1) We carry out an options appraisal exercise when we update our plan every 5 years. This exercise is usually carried out by an external consultant and looks at new options as well as options that were previously considered but were not taken forward for a variety of reasons. Cost is one of the factors considered in the options appraisal process but is not the only determining factor. We have also looked at factors such as volume of water that an option can provide, its resilience to climate change, environmental impact etc. in addition to capital and operating costs. The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for Progressing Infrastructure Development (RAPID) gated process.</p> <p>2) Water from the water recycling plant will be used all year round to supply Southern Water customers, following further environmental restrictions including abstraction limitations from Natural England's Common Standards Monitoring Guidance conditions. These conditions set new year-round flow targets for the River Itchen and proposed targets for future implementation on the River Test, reducing the water available, both in the summer and winter.</p> <p>The advanced treatment processes used in water recycling, including reverse osmosis, are used around the world to remove nutrients, pharmaceuticals and other impurities from water to create purified recycled water.</p> |

|-----------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           |          | <p>3) A further consultation on water quality will be held in 2025. This will include details of the likely impacts on water quality in the reservoir and the Solent and potential mitigations.</p> <p>4) The Environment Agency will determine the permits for the release of purified recycled water into the reservoir and will monitor them. The Environment Agency ensure compliance of all discharges.</p> <p>5) Supplementing Havant Thicket reservoir with purified recycled water will create a new sustainable source of supply.</p> <p>6) Building on former landfill sites is commonplace and, when done carefully, poses little risk to the environment. SW has purchased "Site 72", an industrial site which includes former landfill, near Portsmouth Harbour WTW as the proposed location for the water recycling plant. We intend to locate all of the process plant above ground on foundations piled down to firm strata below the landfill. Any potential impact from construction or operation of the project, and proposed mitigation, is part of our ongoing Environmental Impact Assessment. Best-practice measures and construction techniques will be used to fully address any risks relating to the landfill. We have provided further insight into our decision-making on site selection, risk consideration and mitigation measures in our main statement of response.</p> <p>7) Work formally paused on investigating and developing Fareham Wastewater Treatment Works as a back-up option in May 2023, in agreement with RAPID, and so we have not developed it to the same level as HWTWRP. A Back Up option was also identified. This involved transfer of recycled water from a water recycling plant to Itchen WSW via an environmental buffer. Desalination options were removed from further consideration at this stage. The outcome of the options appraisal process was supported by RAPID at Gate 2. Although both HWTWRP and the Back Up option were able to meet requirements of supplying 75Ml/d in the Western Area (as required by WRMP19), and were able to meet the identified future need of up to 90Ml/d, HWTWRP presented significantly better value for customers and was better able to meet long-term regional supply requirements due to improved adaptability. Therefore, the focus was on progressing HWTWRP as the selected option.</p> <p>8) With regard to the consideration of small storage schemes, we have to meet very challenging demand management and Environmental Destination targets set by the Government. The resulting scale of supply-demand balance deficits requires us to be ambitious as well as innovative to meet future challenges. Environmental sustainability is a key criterion for including options in our plan, regardless of the size of the option.</p> <p>We have considered the relocation of existing surface water abstractions to new abstraction points further downstream, closer to the tidal limit. For example, we considered relocation of the River Itchen WSW abstraction to a point nearly 11km downstream just upstream of the tidal limit of the River Itchen. This not viable because of</p> |

|           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>the reduction in abstraction licences on the whole river and groundwater system and because of the impact on migratory fish.</p> <p>9) Regarding transparency, our Statement of Exclusion published on our consultation web page (see below) detailed those documents that were not published online due to material being commercially sensitive, or restricted under section 37(B) of the Water Industry Act 1991, or 'the Act' (as amended by the Water Act 2003). We are required to make sure that all published documents comply with the Security and Emergency Measures Direction (SEMD). Restricted documents/ sections are available for view via appointment in our head office in Worthing. For the fdWRMP24 we are making as many of the documents available on our website as possible although some information has been redacted so as to comply with SEMD and, in line with guidance, we do not publish any material of a commercially confidential nature.</p> <p>10) Water recycling inevitably uses more energy and subsequently has a higher cost than conventional sources of supply such as groundwater or rivers, due to the advanced treatment techniques used. However, those conventional sources are no longer available to us as they once were.</p> <p>Just like water across the country has its own distinct taste influenced by the geology of the local area, the water taken from the reservoir may taste different from existing supplies due to the spring water being open to the elements. The taste would also vary if recycled water is added, but the water at customers' taps will continue to meet strict drinking water quality standards and be wholesome to drink. We are working closely with international experts, regulators and environmental organisations to develop the plans and ensure this. We don't expect customers to buy bottled water when the clean, wholesome water coming from their taps continues to meet strict UK water standards and is many hundreds of times cheaper.</p> <p>We know our past performance was not good enough and we have apologised for that. We also know that as a direct result of not meeting customer expectations, we have a lot of work to do to rebuild trust with our communities. This is why we have been working hard to deliver our Turnaround Plan, for a short sharp improvement in performance across the board, and why we have set out our most ambitious investment programme ever for the years ahead after listening to our customers:</p> <p><a href="https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/">https://www.southernwater.co.uk/about-us/our-plans/turnaround-plan/</a></p> |
| WRMP1050  | <p>I have recently learned of Southern Water's proposal to use effluent recycling to supply water to augment our future water supply. I am particularly concerned that having just learned about this initiative the closing date for consultation is the 4 December (i.e. almost immediately). My understanding was that the new reservoir being constructed at Havant Thicket was to use water from traditional sources, such as local chalk springs. I now discover that it is going to be part of this scheme, storing recycled effluent.</p> <p>My fundamental objection to the proposal is that it does not make intuitive sense to recycle effluent in a country where there should be adequate fresh rainwater, especially as recent</p> | <p>Thank you for reviewing our rdWRMP24 and providing feedback. We note your concern to the use of recycled water in Havant Thicket.</p> <p>We fulfilled the expectations from planning guidance regarding our visibility, but we welcome suggestions as to how you would like to see our engagement develop, and we will take that on board for future consultations.</p> <p>The selection of Hampshire Water Transfer and Water Recycling Project (HWTWRP) followed a thorough options appraisal process carried out as part of the Regulators' Alliance for</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|           | <p>indications suggest winter rainfall levels are rising. Rather than embarking on a massive construction project with all the adverse environmental impacts, a more sustainable solution would be to reduce leakages in the current pipework system.</p> <p>Southern Water, in common with many other water companies, have a poor record on environmental safeguarding and I fear that this project, using an untried method in the UK, may produce new adverse impacts</p> | <p>Progressing Infrastructure Development (RAPID) gated process. Southern Water's Gate 1 and Gate 2 submissions to its regulators in both 2020 and 2021 confirmed investigation of alternative options for both water recycling and water transfers involving Havant Thicket Reservoir.</p> <p>Our supply area is classed as being under 'serious water stress' by the Environment Agency. Please see <a href="#">here</a>. Supplementing Havant Thicket reservoir with purified recycled water will create a new sustainable source of supply. Water recycling is widely used around the world to create a new source of supply that means less water needs to be taken from the environment supporting wildlife, particularly in a drought.</p> <p>Regarding leakage reduction, the leakage reduction target set by the Government is 50% by 2050. We are planning to go beyond the target and reduce leakage by 53% by 2050. The target is based on what can realistically be achieved with existing technologies and includes a mains replacement programme that will see the length of mains replaced increase significantly over each successive 5-year planning period. We will be looking at emerging and new technologies in this field with the aim of using of them if they can deliver quicker and/or greater reductions in leakage going forward.</p> <p>Regarding possible operational issues, the plant will monitor the quality of the treated effluent from Portsmouth Harbour WTW and will shut down if this moves outside of the treatable parameters. The recycled water will also have a lower nitrate level than the spring waters, due to the treatment at Portsmouth Harbour WTW.</p> |
